Acknowledgement

First and foremost, thanks to **ALLAH**, the most gracious, the most merciful.

I would like to express my sincere gratitude to **Prof. Dr. Safwat Abdelkader Salem**, *Professor of general and plastic surgery, faculty of medicine, Cairo University*, who honored me by his supervision and continuous help. I can not thank him for his valuable encouragement and continuous guidance.

I am so much obliged to **Dr. Moheb Samir Kamel**, *lecturer of general and plastic surgery, faculty of medicine, Cairo University* for his continuous guidance and valuable advises throughout this work. I am much grateful for his great help and support throughout this work.

Special thanks to all teaching staff, and my colleagues in department of surgery for their continuous and endless encouragement and respect.

Dedication

To my family, especially my parents, for their encouragement, patience, and assistance over the years. I am forever indebted to my parents, who have always kept me in their prayers.

And to my brothers, my sisters and to my beloved wife.

List of figures

Figure Number	Title	Page
1	The head of a human embryo in the sixth week: ventral aspect.	2
2	Formation of the tooth at successive stages of development	3
3	Mandible, A.External surface B. Internal surface	6
4	Temporomandibular joint. A. Mouth closed. B. Mouth open.	10
5	Muscles attached to inner and outer surfaces of the mandible.	13
6	Suprahyoid muscles. Inferior view.	13
7	Nerves related to the mandible.	16
8	Relationship of the facial artery and vein, the marginal mandibular branch of the facial nerve, to the inferior border of the mandible and masseter muscle	17
9	Maxillary artery and its branches.	19
10	Muscles producing movements of the mandible. The arrows indicate the direction of their actions.	21
11	The classification system for occlusal relationships, first developed by E. H. Angle, is based on the relation of the maxillary and mandibular first molars to one another.	27
12	The regions of the mandible and the percentage of fractures occurring within each region.	30
13	Favorable and unfavorable fractures & The direction of the muscle pull in fractures	35
14	Patterns of mandibular fractures	37
15	A panoramic radiograph showing rotated proximal segment of the right mandibular angle fracture.	46
16	Lateral oblique view shows a fracture in the angle area	47
17	Posterior-anterior view demonstrates a fracture in the body area of the mandible	47
18	Towne's view shows a displacement of condylar fracture	48
19	CT scan of head showing: A. left parasymphiseal fracture, B. condylar neck fracture with displacement of the fragment	49
20	Maxillofacial computed tomography three-dimensional reconstruction of a patient with a comminuted right parasymphiseal fracture and a left ramus linear fracture.	50
21	Four-screw maxillomandibular fixation for minimally displaced subcondylar fracture.	60
22	Correct passive adaptation of a plate to the mandible with a slight overbend at the fracture site.	62
23	Compression with a plate: The two intermoast screws should	63

	be placed eccentrically within the DC holes. As these screws are driven in , they approximates the fragments. With final tightening of the screws, compression is achieved.	
24	Parasymphyseal fracture treated with two horizontal lag screws.	64
25	Monocortical placement of a miniplate near the superior border of the mandible functions as a tension band.	67
26	Condylar Fracture classification	69
27	Landahl’ s classification of condylar fractures: (A). Based on anatomical location of the fracture. (B). Based on the relationship of the condylar segment to the mandibular segment. (C). Based on the relationship of the condylar head to the glenoid fossa.	72
28	A. Preauricular incision, and B. endaural modification of preauricular incision .	75
29	Methods of immobilization of Condyle.	76
30	For fractures of the angle, a plate applied at the superior border of the mandible is much more effective than a plate applied at the inferior border. This is because metallic plates have good tensile strength.	80
31	Panoramic radiograph showing the use of a three-dimensional “ strut” or “geometric” plate applied to a fractured mandibular angle.	81
32	Surgical approaches to the facial skeleton: (a)bicoronal with preauricular extension, (b)paranasal, (c)superior tarsal crease, (d)subciliary, (e)transconjunctival with lateral canthotomy, (f)maxillary vestibule, (g)mandibular vestibule, (h)cervical crease.	98
33	Treatment rationale for pathological fracture of mandible.	106
34	Age incidence of mandibular fractures	120
35	Distribution of mandibular fractures according to mode of trauma	121
36	Preoperative CT scan of a facial bone of patient 31 years old showing fracture of right mandibular condyle	123
37	Intraoperative photo showing fixation of the condylar fracture using plate and screws with wires through preauricular approach	123
38	Postoperative CT scan of face coronal view showing internal fixation of condylar fracture	123
39	A. Preoperative 3D CT scan of the facial bones for 24y old male showing left subcondylar fracture. B. Preoperative CT face coronal view showing subcondylar fracture	124
40	Intraoperative photo showing fixation of condylar segment with plate through preauricular approach	124
41	Postoperative Panorama view showing reduction and fixation	125

	of left subcondylar fracture using plate and 4 screws	
42	Postoperative photo of the same patient with left subcondylar fracture after release of MMF	125
43	Preoperative panorama X-ray of a 30 years old patient with right angle fracture	126
44	Intraoperative photo showing internal fixation of the angular fracture using 2 plates and screws through an extra-oral approach	126
45	Preoperative CT scan of facial bones of patient 42y old with right mandibular comminuted parasymphiseal fracture	127
46	Intraoperative photo of patient showing reduction of the fracture segments and fixation with two plates and screws through the lacerated wound that was caused by the trauma	127
47	Post operative panorama view showing internal fixation of the right comminuted parasymphiseal fracture using 2 plates and screws	128
48	Preoperative Panorama X-ray for a 25 years old male patient presenting with defect fracture in the left body of the mandible following previous fixation that was resulted in bone necrosis and lost of bone segment	128
49	Intraoperative photo showing internal fixation of mandibular defect using bone graft (arrow) and titanium mesh through extraoral approach	129
50	Post operative panorama view of the same patient showing internal fixation by titanium mesh and screws applied on the bone graft and MMF was done	129
51	Preoperative panorama X-ray of a 23 years old patient with right parasymphiseal malunited fracture	130
52	Intraoperative photo showing internal fixation of old malunited parasymphiseal fracture using 2 plates above and one plate cross-shaped below through transoral approach	130
53	Preoperative photo of a 24 years old male patient with panfacial fractures due to motor vehicle accidents	131
54	Preoperative CT scan axial cuts showing right parasymphiseal mandibular fracture	131
55	Intraoperative photo showing MMF and ORIF of the right parasymphiseal fracture	132
56	Intraoperative photos (same patient) showing fixation of other facial fractures: A) Right Z-M buttresses. B) Left Z-M buttresses. C) Left inferior orbital rim. D) Right inferior orbital rim	132

MMF	Maxillomandibular fixation
MPR	Multiplaner radiograph
ORIF	Open reduction and Internal fixation
ORN	Osteoradionecrosis
PTOM	Posttraumatic osteomyelitis
RIF	Rigid internal fixation
Rpm	Rate per minute
TMJ	Temporomandibular joint
V3	The third division (mandibular nerve) of the fifth cranial nerve

INTRODUCTION

Maxillofacial injuries occupy an important place in our practice. Fracture mandible is one of common entities of maxillofacial injuries which will be focused on.

Few injuries are as challenging as those of the face, surgeons who undertake treatment of facial injuries have a dual responsibility; repair of aesthetic defect (restoration of the primary appearance) and restoration of function. A third goal is to minimize the period of disability. **(Manson PN, 2006)**

Mandibular fractures is the second most common facial fractures. There has been significant increase in the number of cases in the last years, misidentification and inadequate treatment can lead to permanent aesthetic and/or functional deformity. **(Patrocinio et al., 2005)**

Mandibular fractures can occur with external trauma, motor vehicle accidents, falls, fist fight, missile injuries and sporting accidents, Motor vehicle collisions are the most common cause of mandible fractures. **(Fischer et al., 2001)**

The primary consideration in the treatment of fractures of mandible is to restore the function and efficiency of the jaw and the occlusion of the dentition, the methods of treatment may vary with the age and the general health of the patient, the training of surgeon, the facilities

and circumstances for treatment, and the condition under which the patient is to be treated. (**Laskin et al., 2000**).

Aim of Work

Among our practice in the management of fracture mandible, certain difficult cases came up which did need certain planning and special handling.

In this work we will try to define what is difficult and what are types of difficulties, and to settle for purpose of plan of treatment.

Review of Literature

ANATOMY OF THE MANDIBLE

Embryology of mandible

The pharyngeal arches begin to develop early in the fourth week as *neural crest cells* migrate into the future head and neck regions. The first pair of pharyngeal arches, the primordium of the jaws, appears as surface elevations lateral to the developing pharynx. **(Moore, 2007).**

By the end of the fourth week, four pairs of pharyngeal arches are visible externally (Fig.1). The fifth and sixth arches are rudimentary and are not visible on the surface of the embryo. The pharyngeal arches are separated from each other by the pharyngeal grooves. Like the pharyngeal arches, the grooves are numbered in a craniocaudal sequence. **(Moore, 2007).**

The first pharyngeal arch (mandibular arch) separates into two prominences:

- The maxillary prominence gives rise to the maxilla, zygomatic bone, and a portion of the vomer.
- The mandibular prominence forms the mandible. The proximal mandibular prominence also forms the squamous temporal bone. **(Moore, 2007).**

The mandible forms in dense fibromembranous tissue lateral to the inferior alveolar nerve and its incisive branch and also in the lower parts of Meckel's cartilage. **(Langman, 2009).**

Meckel cartilage, the cartilage of this arch, develops in this arch, forming a primitive support. Later, Meckel cartilage regresses and forms two of the bony ossicles, the incus and malleus of the middle ear dorsally, whereas ventrally the cartilage becomes incorporated into the mandibular symphysis. However, it should be noted that most of the mandible develops by intramembranous bone formation rather than by endochondral formation on Meckel cartilage. (Hiatt et al., 2010).

Bony union of the two halves of the mandible occurs in the 2nd year of life. (Ellis, 2006).

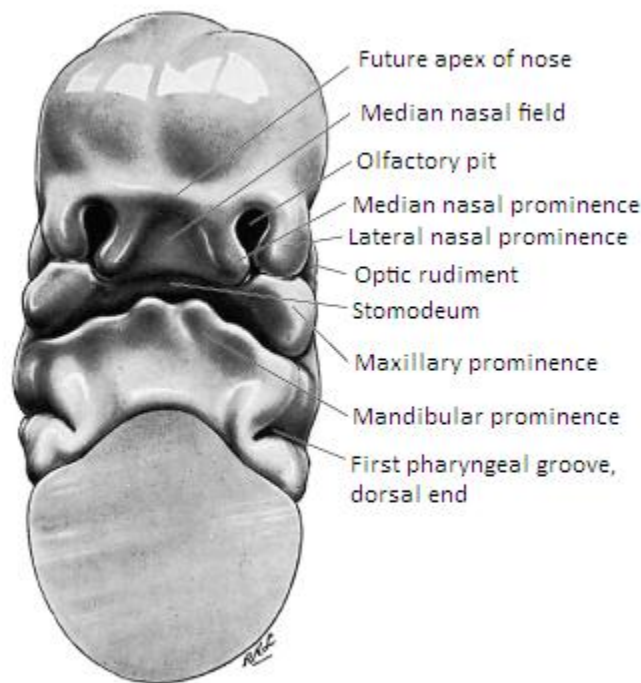

Fig.(1) The head of a human embryo in the sixth week: ventral aspect. (Standring, 2005).
