

Somnographic study of respiratory parameters in asthmatic children

Thesis

**Submitted for partial fulfillment of master degree in
Pediatrics**

By

Mohamed Said Elkhawaga

M.B., B.Ch (2001)

Al-Azhar University

Under Supervision of

Doctor. Malak Ali Shaheen

Assistant Professor of Pediatrics

Faculty of Medicine

Ain Shams University

Doctor. Asmaa El-Hussieny Ahmed El-Sharkawy

Lecturer of Pediatrics

Faculty of Medicine

Ain Shams University

Acknowledgement

First of all thanks to ALLA

*I wish to express my deepest thanks, gratitude and profound respect to **Dr. Malak Ali Shaheen**, Assistant Professor of Pediatric, Faculty of Medicine, Ain shams University, for her meticulous supervision. I consider myself fortunate to work under her supervision.*

*I am also deeply grateful and would like to express my sincere thanks and gratitude to **Dr. Asmaa El-Hussieny Ahmed El-Sharkawy**, lecturer of Pediatrics, Faculty of Medicine, Ain Shams University for her great help and continuous contributions and great effort all the way.*

*Last but not least, I would like to express my endless gratitude to **my dear patients** and their parents for their cooperation in accomplishing my thesis, wishing them a good health, and **my colleagues** for their support and help.*

Mohamed

INTRODUCTION

Many asthmatic children get awake with symptoms of their disease almost every night. A growing body of evidence indicates that the causal pathway of cytokine changes resulting from asthma may influence the neurochemistry of sleep regulation. Equally possible is that sleep disturbance resulting from asthma promotes further changes in neuropeptides, which in turn influence the course of asthma (*Mastronarde et al., 2004*).

Asthma, airway inflammation, and sleep are thus linked in a complex set of relationships in need for evaluation (*Hasler et al., 2004*).

Aim of the work

The aim of this study is to assess the respiratory symptoms and parameters during sleep of asthmatic children.

Chapter (1)

Pediatric Bronchial Asthma

Definition:

Asthma is a chronic inflammatory disease of the lungs that affect a large proportion of population worldwide and can be fatal. Prevalence of asthma varies from country to country and is increasing, particularly in children (*GINA, 2007*).

Despite the availability of highly effective treatments, for most asthmatic children, morbidity remains high and control of asthma is far from optimal (*Grize et al., 2006*).

Pathology and pathophysiology of bronchial asthma:

To evaluate the airway pathology in bronchial asthma, bronchial biopsies were obtained from asthmatic children by bronchoscopy and compared with normal.

The pathology of bronchial asthma including multiple changes in the airway like shedding of the epithelial cells ,thickening of the basement membrane, mucous plugging, inflammatory cells infiltration, smooth muscle hypertrophy and hyperplasia (*Tattersfield et al .,2002*).
