

Faculty of Medicine-Ain Shams University

Study of Impact of Hemodialysis and Renal Transplantation on Quality of Life in Egyptian ESRD Patients

Thesis:

Submitted for partial fulfillment of master degree in
Internal Medicine

By:

Ahmed Mohamed Ayed

M.B., B.Ch

Faculty of Medicine, Ain Shams University

Supervised by:

Prof. Dr. Khaled Hussein Abou Seif

Professor of Internal Medicine and Nephrology

Faculty of Medicine, Ain Shams University

Dr. Dawlat Hussein Sany

Lecturer in Internal Medicine and Nephrology

Faculty of Medicine, Ain Shams University

Dr. Doaa Nader Radwan

Lecturer in Psychiatry, Department of Neuropsychiatry

Faculty of Medicine, Ain Shams University

2010

ACKNOWLEDGEMENTS

I feel privileged to have had the opportunity to work on this thesis and there are a number of people who have, in one way or another, made it possible for me to write this thesis...

*First and foremost, I would especially like to thank my supervisors, **Prof. Dr. Khalid Abou Seif** for serving as my advisor and special thanks to **Dr. Dawlat Hussein Sany** and **Dr. Doaa Nader Radwan** for their support, encouragement and advice. Besides helping me in gathering data about my thesis, they never refused giving them time and advice when needed. Moreover this thesis may never have been completed without their support and participation in every step of the process...*

*Also many thanks to **Dr. Yaser Mahmoud Elshahawy** for giving me advices and supports throughout my thesis work...*

*I would like to thank the Head of Nephrology Department in National Institute of Urology & Nephrology; **Dr. Ashraf Donia** for his great support and giving me the chance to gather information from the clinic about the transplant recipients...*

*My special and sincere thank to my wife **Reham Obied**. Actually she almost was participating and helping me in every step in this research work...*

I would like to thank my father and my mother for their support and help during the preparation of this thesis and also the rest of my family for their love and support...

And not to forget, a lot of friends and acquaintances who helped to take my mind off work from time to time, I hope that we will be able to stay in touch...

List of Abbreviations

- * **ACEI** : Angiotensin-converting enzyme inhibitors
- * **ARB** : Angiotensin II type 1 receptor blockers
- * **BP** : Bodily Pain
- * **CAPD** : Continuous ambulatory peritoneal dialysis.
- * **CBC** : Complete Blood count.
- * **CCPD** : Continuous cyclic peritoneal dialysis.
- * **CRF** : Chronic renal failure.
- * **DIA-QOL**: Dialysis quality of life.
- * **DM** : Diabetes mellitus.
- * **EPO** : Erythropoietin.
- * **ESRD** : End stage renal disease
- * **GH** : General Health.
- * **GN** : Glomerulonephritis.
- * **Hb** : Hemoglobin.
- * **HD** : Hemodialysis.
- * **HRQOL** : Health related Quality of life.
- * **HTN** : Hypertension.
- * **IHD** : Ischemic Heart disease.
- * **KDQOL** : Kidney disease Quality of life.
- * **KDQOL-SF**: Kidney disease Quality of life short form
- * **KI** : Karnofsky Index.
- * **MCS** : Mental component summary.
- * **MH** : Mental health
- * **MMF** : Mycophenolate mofetil.
- * **NIPD** : Nocturnal intermittent peritoneal dialysis.
- * **OARS** : Older American research and service center.

- * **PCS** : Physical component summary.
- * **PD** : Peritoneal dialysis.
- * **PF** : Physical function.
- * **PTDM** : Post – Transplant diabetes mellitus.
- * **RE** : Role / Emotional
- * **RP** : Role / Physical.
- * **RRT** : Renal replacement therapy
- * **SF-36** : Short form 36 Item
- * **SIP** : Sickness Impact profile.
- * **TLC** : Total leucocytic count.
- * **TTO** : Time trade – off
- * **TX** : Transplantation
- * **WHO** : World health organization.

Introduction

Introduction

End-Stage Renal Disease (ESRD) represents a clinical condition in which there has been an irreversible loss of endogenous renal function of a degree sufficient to render the patient permanently dependent on renal replacement therapy (dialysis or transplantation) to avoid life-threatening uremia (*Braunwald et al., 2001*).

One of the main points when treating patients with ESRD, whose cure is not a realistic goal, is maximizing functioning and well-being, which refer to the ability to perform various daily activities and functions and to more subjective internal states such as symptoms and feelings. Patient-assessments of functioning and well-being are variously referred to as health-related quality of life (HR-QOL), health status, and functional outcomes (*Kutner and Jassal, 2002*).

The measurement of health-related quality of life (HRQOL) has become increasingly common in recent years as an important indicator of health and well-

being. Health related quality of life outcome data are frequently used to determine healthcare effectiveness, including medication and procedural treatment effects as well as resource allocation and policy development (*Bryan & Longworth, 2005*).

Health-related quality of life is an important issue for chronic kidney disease (CKD) patients receiving hemodialysis. Hemodialysis, although not a cure for CKD, helps prolong and improve patients' quality of life (*Korevaar, et al., 2002*).

Although hemodialysis and peritoneal dialysis partially correct the symptoms experienced by the patient and provoke additional changes in the patients' life style, Transplantation appears to give the best QOL for large group of patients (*Tsuji-Hayashi et al., 1999*)

Health-related quality of life (HRQOL) may also be affected by the clinical manifestations of the disease, the side effects of treatment and relationships

of the patients with family members and care providers (*Valderrabano, et al., 2001*).

Previous studies from various countries have been performed to find factors that affect the quality of life of patients with ESRD. Although there are some inconsistencies between their results, overall physical factors such as levels of hemoglobin, albumin, and normalized whole body urea clearance or protein catabolic rate; psychosocial factors such as marital status, depression, and anxiety levels; together with socio-demographic and clinical factors such as age, gender, duration of renal disease and dialysis, co-morbid physical illness (e.g., diabetes), all seem to have a significant effects (*Kimmel and Patel, 2006*).
