Acknowledgment

First and Foremost, thanks to ALLAH

I am extremely grateful to **Prof. Dr. Farida El-baz Mohamed Elbaz**, Professor of Pediatrics, for her kind unlimited help, guidance and valuable advice in achievement of this thesis. I express my deep gratitude and appreciation for encouragement throughout this work.

I am extremely grateful to **Prof. Dr. Yaser Abd El-azem**, Professor of Radio diagnosis, for his endless flow of advice, appreciable guidance, and continuous support throughout this work.

I am extremely indebted to **Dr. Reham Mohamed Elhossiny Abd El-Basir**, Lecturer of Pediatrics, for her illuminating discussion, kind cooperation, helpful direction and continuous effort.

Finally, I would like to thank my parents and husband for their help and cooperation .

To all of those who helped, Thanks a lot.

Marian Girgiss Rizk

Introduction

Autism is a syndrome characterized by impairments in social relatedness and communication, repetitive behavior, abnormal movements, and sensory dysfunction (*Bernard et al., 2001*).

Numerous studies of autistic individuals have revealed evidence of cerebral hypoperfusion, neuro-inflammation and gastrointestinal inflammation, immune dysregulation, oxidative stress, relative mitochondrial dysfunction, neurotransmitter abnormalities, impaired detoxification of toxins, and impaired production of porphyrins. Many of these findings have been correlated with core autistic symptoms. For example, cerebral hypoperfusion in autistic children has been correlated with repetitive, self-stimulatory and stereotypical behaviors, and impairments in communication. Hyperbaric oxygen therapy (HBOT) might be able to improve each of these problems in autistic individual (*Ohnishi et al., 2000*).

Specifically, HBOT has been used and can compensate for decreased blood flow by increasing the oxygen content of plasma and body tissues. HBOT has been reported to possess strong anti-inflammatory properties and has been shown to improve immune

Introduction

function. There is evidence that oxidative stress can be reduced with HBOT through the upregulation of antioxidant enzymes. HBOT can also increase the function and production of mitochondria and improve neurotransmitter abnormalities. In addition, HBOT upregulates enzymes that can help with detoxification problems specifically found in autistic children. Impaired production of porphyrins in autistic children might affect the production of heme, and HBOT might help overcome the effects of this problem. HBOT has been shown to mobilize stem cells from the bone marrow to the systemic circulation. Recent studies in humans have shown that stem cells can enter the brain and form new neurons, astrocytes, and microglia. It is expected that amelioration of these underlying pathophysiological problems through the use of HBOT will lead to improvements in autistic symptom (*Rossignol, 2006*).

Studies have demonstrated hypoperfusion to several areas of the autistic brain, most notably the temporal lobes (*Ohnishi et al., 2000*).

Several studies show that reduced blood flow to the temporal regions and other brain areas correlates with many of the clinical findings associated with autism including repetitive, self-stimulatory and stereotypical

≡ *Introduction*

behaviors, and impairments in communication, sensory perception, and social interaction (*Boddaert et al., 2004*).

Diminished blood flow to the thalamus has been correlated with the autistic clinical features of repetitive, self-stimulatory, and unusual behaviors including resistance to changes in routine and environment (*Starkstein et al., 2002*) Another study on “high functioning” autistics demonstrated decreased blood flow to areas of the temporal lobe and amygdala, which was correlated with clinical impairments in processing facial expressions and emotions (*Critchley et al., 2000*).

In one study, hypoperfusion of the prefrontal and left temporal areas worsened and became “quite profound” as the age of the autistic child increased. This diminished perfusion correlated with decreased language development. The authors concluded that hypoperfusion “subsequently prevents development of true verbal fluency and development in the temporal and frontal areas associated with speech and communication” (*Wilcox et al., 2002*).

Aim of the Work

The aim of this work is to study the effect of hyperbaric oxygen therapy in autistic Egyptian children.

Autism

Definition:

Autism is a neuro-developmental disorder in the category of pervasive developmental disorders, characterized by problems of social communication, inflexible language and behavior, repetitive sensory-motor movements (*Eigesti et al., 2003; Georgiades et al., 2007*).

Both The Diagnostic and Statistical Manual of Mental Disorders DSM-IV-TR (fourth edition, text revision) (American psychiatric Association, 2000), international classification of diseases, 10th edition (ICD-10) (*WHO, 1993*) stated that pervasive developmental disorders (PDD)- more often referred today as autism spectrum disorders- include as shown in table (1):

1. Autistic disorder.
2. Asperger's syndrome.
3. Pervasive developmental disorder-not otherwise specified (PDD-NOS) PDD-NOS; also called atypical autism) is diagnosed when the criteria are not met for a more specific disorder (*Volkmar et al., 2009*).
4. Rett's syndrome.
5. Childhood disintegrative disorder.

All these disorders are characterized by varying degrees of impairment in communication skills, social interactions, and restricted, repetitive and stereotyped patterns of behavior (*WHO, 2007*).

Table (1): Types of Pervasive developmental disorders.

Characteristic	Autistic disorder	Asperger's disorder	CDD	Rett's disorder	PDD NOS
Age at onset	< 3 yr	Variable	2–10 yr	5–30 mo	Variable
Presence of regression	Mild, in minority of patients	No	Yes	Yes	No
Gender	M/F ratio 4:1	M>F	M>F	F primarily	M>F
Mental retardation	Present in majority	Absent in majority	Often severe	Often severe	Variable
Social impairment	Yes	Yes	Yes	Yes	Yes
Communication impairment	Yes	No ^a	Yes	Yes	Variable
Restricted interests/repetitive behaviors	Yes	Yes	Yes	Yes	Variable

DSM-IV, *Diagnostic and statistical manual of mental disorders*, fourth edition (7); F, female; M, male; M>F, more males than females. ^aPragmatic and/or social language may be impaired.

(American Psychiatric Association, 1994)

Regressive autism

A subgroup of children with ASDs experiences a “regression,” meaning they stop using the language, play, or social skills they had already learned. This regression usually happens between the first and second birthdays (*Lord et al., 2004*).

Types:

Autism is divided into low-, medium- or high-functioning autism (LFA, MFA, and HFA), based on IQ thresholds (*Baron, 2006*).
