MY GREAT PARENTS,  
AND BELOVED WIFE  
MAY GOD BLESS THEM ALL**

# **Statement**

This dissertation is submitted for the partial fulfillment of the requirements of mechanical engineering department in Ain-Shams University for the degree of **doctor of philosophy**.

The work, included in this research, is carried out by the author and no part of it has been submitted for a degree or qualification at any other university.

**Signature**

**Ashraf I. Sharara**

# ACKNOWLEDGEMENT

Many Thanks to **God** for the completion of this research work at the convenient time. I would like to thank **Prof.Dr. Zakria Ghoneim**, thesis supervisor, for his perpetual participation and valuable scientific assistance during the research.

In addition, I forward my great thanks and appreciation to **Prof.Dr. El Sayed Saber**, thesis supervisor, for his kind assistance and help, especially in the designing stage of the test rig, as well as his tremendous effort in revising the transcript of this research.

Moreover, I highly appreciate the effort, support, guidance, encouragement and assistance of **Asst.Prof.Dr.Amr Aly**, especially during the execution of computational fluid dynamic studies of the present work.

I would like also to present a very special thank to **Dr. Yasser Abdel Razak, Faculty of Engineering-Alexandria University**, for his help , assistance and valuable guidance in the executed Computational Fluid Dynamics study. I am also grateful to the all members of staff at the **Arab Academy for Science and Technology and Maritime Transport** for their moral and financial supports.

I would also like to thank all members of staff in the maintenance sector at **Abu Qir Fertilizers Company**, for their help in the manufacturing of the experimental test rig, especially, **Eng.Kairy El Shamy, Eng.Ayman El Geziry and Eng. Ahmed Salem**.

Least but not Last, I give special thanks to **my parents and wife** for their support and encouragement during the whole period of my Ph.D. study at Ain Shams University.

# ABSTRACT

One of the main sources of the flow – induced vibration in the piping systems is the presence of control valves. When the valve operates at relatively small openings and under certain operating conditions, vibration problems arise from the interaction between the valve configuration and the fluid flow. Therefore, the valve, as well as the piping system will experience severe vibration levels. The impact of the vibration may result in fracture damage in the valve and/ or the piping system. The present research work is dedicated towards the study of the interaction between the configuration of a flat -face globe valve, operating at different openings, and the fluid dynamics in the oscillating systems. A hybrid study of numerical and experimental work is to be conducted. A mathematical model for the flow, passing through the control valve, has been developed. The flow model was numerically solved by using FLUENT 6.3 commercial code. The numerical results were obtained for different valve openings and operating conditions. The incompressible turbulent flow, through the valve, was found to be transient for a small period. Then, the flow reaches a steady-state condition. Moreover, the observed flow phenomenon was found to be a circumferential jet flow that comes out from the annular gap between the plug and the seat. The phenomenon is associated with a steady system of vortices, resulting from the interaction between the jet flow and the internal configuration of the valve. On the other hand, a test rig had been designed and manufactured by the author, in order to conduct necessary tests on the control valve, under different operating conditions. The test rig is equipped with all transducers for both flow and vibration measurements. The flow measurement includes the pressure drop across the orifice to calculate the volume flow rate, the upstream and downstream pressures of the valve and the flow force acting on the stem of the valve. The flow measurement was performed by using an S-Shape Load cell, which was designed and developed by the researcher. Moreover, a good correlation between the

numerical and experimental values of the flow force was noticed. On the other hand, the vibration measurement is limited to the valve vibration level. The experimental results indicate that the control valve, under study, is of Quick-Opening Inherent Characteristic. Moreover, the measurement of the volume flow rate and the downstream pressure, for different conditions, were used as actual boundary conditions for the CFD simulations. The flow measurements results were reduced by performing a dimensional analysis for the flow force, acting on the valve stem. Therefore, an empirical formula was obtained between the dimensionless force and the volume flow rate. The dimensionless exciting force decreases as the valve opening increases. For small valve opening values, a little change in the plug position yields to a significant variation in the value of the exciting force which means that the effectiveness of valve position becomes very much pronounced for small values of valve opening. Regarding the vibration measurements, the frequency spectrums for all performed test conditions ( $Re = 1 \cdot 10^5 - 3 \cdot 10^5$ ) and different stiffness of the stem, were found in the low frequency range (up to 55 HZ). Moreover, the reduction of the stiffness of the stem supports yields to an increase in the vibration level. Moreover, for a certain value of valve opening, the increase in the flow rate tends to an increase in the vibration level of the stem. On the other hand, the recirculation zone, occurring at the downstream of the valve plug, as indicated by CFD simulation, causes periodic variations in the pressure differences across the plug with three dominant frequencies of 10.94, 12.5 & 14 HZ. An experimental correlation between Reynolds and Strouhal numbers was obtained. The later was found to be in qualitative agreement with previous research work. Finally, a better understanding of the flow phenomenon and its consequences for the turbulent flow, passing through the globe control valve with flat-face plug, had been achieved.

Acknowledgment	vi
Abstract	vii
Table of Contents	ix
List of Figures	xiv
List of Tables	xvii
Nomenclature	xviii
<b>CHAPTER ONE: INTRODUCTION</b>	
1.1 Problem Definition	1
1.2 Aim of the Work	2
1.3 Thesis Layout	3
<b>CHAPTER TWO: LITERATURE REVIEW</b>	
2.1 Introduction	5
2.2 Literature Review	8
2.2.1 Flow Induced Vibration in Fluid Valves	8
2.2.2 Effect of Valve Configuration	24
2.2.3 Usage of Computational Fluid Dynamics in Analysis of Flow through Control Valves	25
2.3 Conclusion	35

## **CHAPTER THREE: MATHEMATICAL MODELING FOR FLOW TROUGH GLOBE CONTROL VALVE**

3.1	Physical System	36
3.2	Governing Equations	37
3.3	Model Assumptions	38
3.4	Reynolds -Average Navier Stokes (RANS) Equations	39
3.5	Turbulence Modeling	40
	3.5.1 Reynolds Stresses	40
	3.5.2 Eddy Viscosity Hypothesis	40
	3.5.3 $K - \varepsilon$ (Standard) Turbulence Model	41
3.6	Model in Dimensionless Form	42

## **CHAPTER FOUR: NUMERICAL SOLUTION, RESULTS AND ANALYSIS**

4.1	Numerical Solution	45
	4.1.1 Computational Domain	45
	4.1.2 Mesh Generation	46
	4.1.3 Numerical Scheme	48
	4.1.4 Steady-State Iterative Algorithm	52
	4.1.5 Unsteady-State Algorithm	53
	4.1.6 Boundary Conditions	54
	4.1.7 Initial Conditions	54
	4.1.8 Convergence Criterion	55

4.2	Numerical Results	56
4.2.1	Steady State Solution	56
4.2.2	Transient Solution	68
4.2.2	Unsteady State Solution	74
4.3	Analysis of Results	82
4.3.1	Steady State Solution	82
4.3.2	Unsteady State Solution	98
<b>CHAPTER FIVE: EXPERIMENTAL SETUP</b>		
5.1	Experimental Test Rig	101
5.1.1	Water Tank	103
5.1.2	Main Chassis	103
5.1.3	Suction Piping System	103
5.1.4	Delivery Piping System	104
5.1.5	Test Section	104
5.2	Test Rig Operation & Control	105
5.3	Control Valve Design Modification	106
5.4	Measurement System	114
5.4.1	Flow Measurement	114
5.4.2	Vibration Measurement	126
5.4.3	Data Acquisition (DAQ) Systems	127
5.5	Evaluation Procedure for Measurement Uncertainty Analysis	130

## **CHAPTER SIX: EXPERIMENTAL RESULTS**

6.1	Test Rig Running Trials	135
6.2	Flow Measurement Results	135
6.2.1	Pressure Measurement	136
6.2.2	Control Valve Inherent Characteristic Curve	141
6.3	Vibration Measurement Results	142
6.3.1	Modal Tests	142
6.3.2	Vibration Measurements for Control Valve	145
6.4	Analysis of Results	155
7.4.1	Measurement Uncertainty Results	155
7.4.2	Analysis of Flow Measurement Results	156
7.4.3	Analysis of Vibration Measurement Results	165

## **CHAPTER SEVEN: CONCLUSION**

7.1	Research Work Summary	167
7.2	Conclusions	168
7.3	Suggestions for Future Work	170

## **APPENDICES**

APPENDIX (A): Flow Transducers Datasheets & Certificates

APPENDIX (B): Vibration Transducers Datasheets & Certificates

APPENDIX (C): Results for Test Rig Running Trials

APPENDIX (D): Calibration Curves for Orifice Meter & Springs

APPENDIX (E): Flow Measurements With and Without Control  
Valve

APPENDIX (F): Hammer Test Results
