Statement

This thesis is submitted to Ain Shams University in fulfillment of the requirements for the Ph.D degree in Electrical Engineering. The included work in this thesis has been carried out by the author at the Electrical Power and Machine Department, Ain Shams University. No part of this thesis has been submitted for a degree or a qualification at any other university or institution.

Name : Nessreen M. Rady A. El-Kader

Date : / / 2013

ABSTRACT

Utilization of solar and wind power has become increasingly significant, attractive and cost-effective, since the oil crises of early 1970s. However, a common drawback with solar and wind energy is their unpredictable nature. As the advantages of solar and wind energy systems became widely known, system designers have started looking for their integration. The term hybrid renewable energy system (HRES) is used to describe any energy system with more than one type of generator usually a conventional generator powered by diesel, and a renewable energy source such as PV, wind, and PV/wind. For remote areas, HRES are often the most cost-effective and reliable way to produce power.

The HRES invariably includes battery storage to meet the demand when either the demand is peak load demand or renewable energy source is not available. Battery storage also smoothen the mismatch between time of occurrence of peak load and maximum power generated. One such HRES are the microgrid and the nanogrid. The sources of special interest for these grids are small (<100 kW) units. The term "micro" and "nano" has been coined to describe the grid capacity. As the microgrid capacity is about 100 kW, while 20 kW capacity for the nanogrid.

A nanogrid is a standalone HRES that uses renewable and non-renewable sources to supply power to local loads. The nanogrid has power electronics converters to interface the sources and loads to the system. The control flexibility afforded by the use of power electronics interface converters opens the door to new transmission and control possibilities.

With the use of power electronics interface converters, renewable sources can be connected directly to a distribution network or combined with other local generators and loads to form an independent power system. As a promising topology for this application, resonant converters offer low switching losses due to zero voltage switching (ZVS) making them popular for high frequency applications. The basic idea of a resonant converter is to operate the MOSFETs with either a minimum distorted sinusoidal voltage or by running a minimum distorted sinusoidal current through it. The switching instant must be selected in proximity to the zero crossing of the sinusoidal voltage or current. The dissipated power will then be very small.

A comparison between resonant converter and conventional converter indicates that the resonant converter has the better efficiency for different values of loading current and improves the efficiency at normal operating point by more than 3% under wide range of input voltage. Results are obtained using Matlab/Simulink.

The control structure of the nanogrid aims to schedule the sources, such that the non-renewable source improves the system reliability during the long-term shortage of the renewable source. This is achieved by Dc-Bus Signaling (DBS) to reduce, as much as possible, the participation of the non-renewable sources in the electricity generation process, taking the maximum advantage of the renewable sources available.

This thesis presents the control method used for sources scheduling of a nanogrid, and it also develops an algorithm that calculates the voltage thresholds for each source which satisfies the aimed scheduling.

However, there are some considerations to improve the system response and extend the functionality towards harmonics mitigation. The performance of the nanogrid is not totally satisfactory as large over shoots may occur in the output voltage, and current disturbances may occur at load side. Interaction can occur between the source and the load interface converters results in an under damped or unstable system in the small signal sense. Thus unit sizing of the nanogrid is necessary to ensure system stability. In this thesis, to improve the system stability the passive filter is designed to damp out the over shoot of the output voltage and to suppress the current disturbances from the load side. Also the system still has low-order harmonics in the load voltage at frequencies that are lower than the resonance frequency of the filter. To solve this problem, the interface controller is used as an active filter to inject harmonics, as well as to interface AC loads to the nanogrid, this can reduce the size of the output passive filter. Active filtering is used to inject the same amplitude of harmonic voltages with an opposite sign to cancel out the grid harmonics.

ACKNOWLEDGEMENTS

First, I would like to express my appreciation for my advisors:

Prof. Dr. Ahmed A. El-sattar has given me a truly invaluable experience for which I greatly indebted, I would like to sincerely thank him for his guidance, support and encouragement.

Dr. Naggar H. Saad First, I would like to thank him for introducing me to the exciting field of power electronics. Second, I would like to thank him helping me through the Ph.D. Study on a timely schedule, which still challenging me every step of the way.

I wish to sincerely thank:

Prof. Dr. Prof. Dr. Sherif O. Faried and **Prof. Dr. Mohamed Abdel-Latif Bader** for being my examiners.

Last, but certainly not least, I would like to thank my family and a special thanks goes to the soul of my father. I would like to thank him for enduring all my questions and thoughts since I was a child. I am grateful for all the opportunities he has given to me, and I would like to thank my friends for everything they have done for me. They have pushed me throughout my academic study, and I certainly owe all of my success to their loving support and guidance.

TABLE OF CONTENTS

LIST OF FIGURES	XII
LIST OF ABBREVIATIONS	XVI
LIST OF SYMBOLS	XVI

CHAPTER (1): INTRODUCTION

1.1- General	1
1.2- Hybrid Renewable Nanogrid	3
1.2.1- Reasons for Nanogrid	4
1.2.2- Nanogrid transmission options	4
1.2.2.1- Transmission Frequency Options.....	5
1.3- Nanogrid Control System	7
1.3.1- General concepts	7
1.3.2- Small HRES requirements	7
1.3.1- Control system	8
1.3.1.1- Topology selection	12
1.4- Thesis Objective	13
1.5- Thesis Outline	14

CHAPTER (2): RENEWABLE SOURCES OF NANOGRID

2.1- Introduction	15
2.2- Photovoltaic Energy	16
2.2.1- PV cell circuit model	18
2.2.2- Module Model	19
2.2.2.1- Current input module model	22
2.2.2.2- Voltage input module model	25
2.2.3- Photovoltaic Array Interface	28
2.2.4- DC-DC resonant converter structure	29
2.2.4.1- Series parallel resonant converter (SPRC)	30

2.2.4.2- Zero voltage switching(ZVS)	30
2.2.5- Full bridge LLC resonant converter with passive damping resistance	32
2.2.6- Conventional PWM converters and resonant mode converters	43
2.3- Wind Energy	47
2.3.1- Wind energy system components	48
2.3.1.1- Windmill	48
2.3.1.2- Towers	50
2.3.2- Electrical power production	50
2.3.2.1- Wind turbine modeling	50
2.3.2.2- Induction generator modeling	51
2.3.2.3- Interface converter	55

**CHAPTER (3):
NON-RENEWABLE SOURCES OF NANOGRID**

3.1- Introduction	59
3.2- Energy Storage	60
3.2.1- Importance of energy storage	60
3.2.2- Choice of storage units	61
3.2.2.1- Battery mathematical model	62
3.2.3- Energy storage system	61
3.3- AC Diesel Generators	67
3.3.1- Modeling of diesel generator	68
3.3.2- Interface converter	72

**CHAPTER (4):
CONTROL SYSTEM OF THE NANOGRID**

4.1- Introduction	75
4.2- Nanogrid Structure.....	76
4.2.1- Modeling and simulation	78
4.3- Control System	79
4.3.1- Discharge control of source/storage interface converter.....	80
4.3.1.1- Calculation of voltage thresholds	84

4.3.2- Charge control of storage/load interface converter	85
4.4- Simulation Results.....	87

**CHAPTER (5):
HARMONICS MITIGATION**

5.1- Introduction	99
5.2- Harmonics Generation	100
5.3- Harmonics Mitigation	100
5.3.1- Active filtering of supply voltage	101
5.3.1.1 Designing of the active filter controller	101
5.4 Stability Analysis.....	108
5.4.1- Passive filter design	110
5.4.2- Stability analysis with AC loads	114
5.4.3- Stability analysis with DC loads	117

**CHAPTER (6):
CONCLUSIONS AND RECOMMENDATIONS**

6.1- Introduction.....	120
6.2- conclusions	120
6.3- Future work	123
6.3.1- Decrease the SSC Response Time	123
6.3.2- DC-Bus conditioning	123
6.3.3- Choice of Energy Storage Unit	124
6.3.4- Load shedding at AC side	124
6.3.5- Protection of DC bus	124
6.3.6- Extended applications of nanogrid	124
