## **ABSTRACT**

15<sup>th</sup> of May and the Qattamiya cities are located to the southeast and east of Cairo city, respectively. Both cities are built on bedrock consisting of limestones intercalated with marls and clays of Middle and Upper Eocene age. These cities are facing serious problems in the building and constructions due to the lack of geological, structural and geotechnical studies on their foundation bedrocks. Accordingly, the Scope of this thesis deals with the geological, structural, geotechnical studies on the foundation bedrocks in the sites of both cities and their environs, which are delimited between latitudes 29° 46` and 30° 02` N and longitudes 31° 16` and 31° 30` E, to throw the light on these problems and hazards affecting them.

Stratigraphically, the exposed rocks in the area are of Middle, Upper Eocene, Oligocene, Pliocene and Quaternary ages. They could be distinguished into nine rock units, Gabal Hof Formation (Middle Eocene), Observatory Formation (Middle Eocene) , El Qurn Formation (Upper Eocene), Wadi Garawi Formation (Upper Eocene), Wadi Hof Formation (Upper Eocene), Anqabiya Formation (Upper Eocene), Gabal Ahmar Formation (Oligocene), Pliocene Deposits and Wadi Deposits (Quaternary).

Geomorphologically, the area under consideration is characterized by the presence of conspicuous land forms. Its topography and geology are intimately related, where the lithology and stratigraphic position of the different beds greatly influence the type of weathering and contribute much to the general shape of the landscape.

Topographically, the area has two plateaus separated by a topographically low area. Gabal Mokattam forms the northern plateau while the southern plateau is marked by a relatively high escarpment on its northern side called here the Tura –Hof-Observatory plateau. The latter is dissected by several deeply incised wadies such as Wadi Degla, Wadi Hof, and Wadi Gibbu. Some topographic lows exist within this plateau representing grabens. Also some topographic heights can be recognized on top of this plateau; e.g. El Qurn Height, El Halawana Height, the Ochsen Ridge, G. Hamadel, etc... Some of the highs and the plateau escarpments are also structurally controlled.

Detailed geological and structural maps has been constructed to show the effect of the faults on the site of the cities. Structural analysis defined several major trends of faults and fractures affecting the study area. The main fault sets have NW-SE and E-W trends. The former is the most dominant and gives rise to a sequence of horsts and grabens.

The GPR studies have been applied on 26 chosen locations within the sites of the cities. Sixteen sites within the 15<sup>th</sup> of May city in addition to 10 profiles collected from the Qattamiya city. These sites were chosen to represent the different districts of the cities as possible and to cover sectors of special interest where subsurface structures or some problems are expected. The main subsurface features recorded are the presence of vertical and inclined fractures, a considerable number of caves at several locations and at different depths. Also, sewage water is encountered in the subsurface of some locations of the Qattamiya city site.

The geotechnical studies on 74 limestone rock samples collected from 15<sup>th</sup> of May city revealed that the foundation bedrocks forming the site of the city are

physically and mechanically heterogeneous (anisotropic) and fall within the weak to medium strong range of the limestones, while their mode of failure is almost of brittle type developing extension, wedge type and single shear fractures. The mechanical properties are controlled by their physical properties, as well as their composition. Statistical relations between the physical and mechanical properties are studied and expressed by empirical equations.

Laboratory tests were performed in accordance on 42 samples collected from the Qattamiya city and its extensions. Analysis of physical properties of the studied Qattamiya soil samples indicates that they have high to very high swelling potentiality. The engineering classification of the studied soil samples is inorganic clay of high to extremely high plasticity.

Based on the detailed structural and geotechnical studies on the area under consideration, some environmental and geologic hazards are encountered and can be grouped as: geotechnical hazards, structural hazards, dissolution hazards, quarry blasting hazards, subsidence hazards, seismicity hazards and air pollution hazards. These hazards are intimately related and mutually affect each other.

Such hazards may also be taken into consideration in the future extension of the cities where necessary.

## **ACKNOWLEDGEMENT**

The author wishes to thank Prof. Dr. Laila A. Fayed, Faculty of Science, Cairo University, for her guidance, supervision, critical readings of the manuscript and her critical comments.

The author also would like to express his deep gratitude to Associate Prof. Mohamed A. Wahed, Faculty of Science, Cairo University for supervising this work, his advises, continuous efforts during field studies and revision of the manuscript, and his continuous encouragement.

Deep thanks to Dr. Nahla Shallaly, Geology Department, Faculty of Science, Cairo University for her help in the interpretation of the Clay minerals

Deep thanks to Mr., Tamer Hassan , Mr., Amir Mohamed Hassan, and Moataz El Shafey, Faculty of Science, Cairo University, for their assistance in the field work.

Finally, I would like to express my deep thanks to all who helped me directly or indirectly to carry out this work.

## **CONTENTS**

ACKNOWLEDGEMENT.....	I
ABSTRACT.....	II
LIST OF CONTENTS.....	V
LIST OF FIGURES.....	IX
LIST OF TABLES.....	XV
CHAPTER ONE: INTRODUCTION.....	1
1.1. Aim of the study.....	3
1.2. Climate.....	5
1.3. The Stratigraphy of the Eocene Rocks.....	6
1.4. Previous work on the stratigraphy of the Eocene rocks east and southeast of Cairo.....	14
1.5. Previous work of the geotechnical studies on the Eocene Rocks.....	18
1.6. Previous work of Structural studies on the Eocene Rocks.....	21
CHAPTER TWO: GEOLOGIC SETTING.....	24
2.1. Middle Eocene:.....	26
2.1.1. Gabal Hof Formation.....	26
2.1.2. Observatory Formation.....	27
2.2. Upper Eocene.....	29
2.2.1. El Qurn Formation.....	29
2.2.2. Wadi Garawi Formation.....	31
2.2.3. Wadi Hof Formation.....	32
2.2.4. Anqabiya Formation.....	32
2.3. Oligocene.....	32
2.3.1. Gabal Ahmar Formation.....	34
2.4. Pliocene.....	34
2.5. Quaternary Deposits.....	37
2.6. Geomorphology of the area east and south east of Cairo.....	37
2.6.1. Topographic features.....	39
2.6.1.1. Heights .....	39
2.6.2. Main drainage lines in 15 <sup>th</sup> of May city and its environs.....	42
2.6.3. Main Drainage lines in Qattamiya city area and its environs.....	44
CHAPTER THREE: STRUCTURAL SETTING.....	50
3.1. Faults.....	56
3.1.1. The NW-SE fault set.....	63
3.1.2. WNW - ESE fault set.....	65
3.1.3. The E-W fault set.....	66
3.1.4. The ENE-WSW Fault set.....	71
3.1.5. Faults cutting across 15 <sup>th</sup> of May city.....	71

3.1.6. Faults cutting across El Qattamiya city.....	72
3.2. Joints.....	77
3.2.1 Fracture analysis of 15 <sup>th</sup> of May city.....	79
3.2.2. Fracture analysis of Qattamiya city.....	102

<b>CHAPTER FOUR: GEOTECHNICAL PROPERTIES OF 15<sup>th</sup> OF MAY CITY.....</b>	<b>115</b>
4.1. Introduction.....	115

4.2.1. Failure, fracture and strength.....	123
4.3. Failure Criteria.....	125
4.4. Physical properties.....	134
4.4.1. Bulk density.....	134
4.4.2. Apparent porosity.....	136
4.5. Mechanical properties.....	136
4.5.1. Uniaxial Compressive Strength. ....	136
4.5.1.1. Classification schemes.....	137
4.5.2. Brazilian test.....	141
4.5.3. Schmidt Hammer Rebound number.....	142
4.5.4. Double shear test.....	146
4.6. Sample preparation.....	148
4.7. Results and Statistical analyses.....	148
4.7.1. Results of physical properties.....	151
4.7.1.1. Porosity .....	151
4.7.1.2. Density.....	151
4.7.2. Results of the mechanical properties.....	151
4.7.2.1. Compressive strength.....	151
4.7.2.2. Tensile strength.....	153
4.7.2.3. Shear strength.....	153
4.7.2.4. Young's modulus.....	153
4.7.2.5. Schmidt hammer test .....	166
4.7.2.6. Modes of failure.....	181
4.8. Mutual relation between compressive strength, Porosity, density, and rebound index.....	185 188
4.9. Mutual relations between tensile strength, porosity and density.....	191
4.10. Mutual relations between shear strength, porosity, and density.....	194
4.11. Mutual relation between young's modulus, porosity, and density.....	197
4.12. Mutual relation between rebound index , porosity and density.....	

<b>CHAPTER FIVE: GEOTECHNICAL PROPERTIES OF QATTAMIYA CITY.....</b>	<b>202</b>
5.1. Introduction.....	202
5.2. Physical Properties.....	213
5.2.1. Initial moisture content.....	213
5.2.2. Bulk Density.....	218

5.3. Consistency of soil.....	217
5.3.1. Liquid Limit (LL).....	217
5.3.2. Plastic Limit (PL).....	220
5.3.3. Shrinkage Limit (S.L).....	224
5.4. Consistency indices.....	225
5.4.1. Plasticity Index.....	227
5.4.2. Liquidity index (LI).....	227
5.4.3. Consistency index (CI).....	231
5.5. Engineering classification of fine soil.....	232
5.5.1. Plasticity Chart.....	233
5.6. Free Swelling Test.....	233
5.7. Clay Mineralogy.....	234
5.8. Colloid content.....	234
5.9. Activity ( $A_c$ ).....	237
5.10. Mutual relation between Initial moisture content, the Bulk density, free swelling and atterberg limits (L.L, P.L, and S.L).....	238
5.10.1. Mutual relation between Initial moisture content and the Bulk Density.....	239
5.10.2. Mutual relation between Initial moisture content and the Liquid Limit (L.L).....	239
5.10.3. Mutual relation between Initial moisture content and the Plastic Limit (P.L).....	240
5.10.4. Mutual relation between Initial moisture content and the Shrinkage Limit (S.L).....	240
5.10.5. Mutual relation between Initial moisture content and the Free Swelling.....	240
5.10.6. Mutual relation between Bulk Density and Liquid Limit.....	243
5.10.7. Mutual relation between Bulk Density and Plastic Limit.....	243
5.10.8. Mutual relation between Bulk Density and Free swelling.....	245
5.10.9. Mutual relation between Liquid limit and Free swelling.....	245
5.10.10. Mutual relation between Plastic limit and Free swelling.....	245
5.10.11. Mutual relation between Liquid and Plastic limit.....	246
5.11. Mitigation of expansive clay soil.....	246
5.12. Minimizing Expansion Effects.....	250
	251

## CHAPTER SIX: SUBSURFACE INVESTIGATION USING GROUND PENETRATING RADAR (GPR).....

6.1. Introduction.....	255
6.2. Data collection.....	255
6.3. Theoretical background and causes of subsurface GPR reflections.....	257
6.4. Inherent limitations of unprocessed GPR data.....	262
6.4.1. Time-zero drift.....	271
6.4.2. Common-offset data collection.....	271
6.4.3. Signal saturation.....	271
6.4.4. Depth of penetration.....	273
6.4.4.1. Limiting Factors in GPR Analysis.....	273
6.4.5. Horizontal and vertical resolution.....	274
6.4.6. Ambient and systematic electromagnetic noise.....	277
6.4.7. Surface reflections.....	281
6.5. Data processing.....	282
6.5.1. Time-zero-drift correction.....	285

6.5.2. Signal-saturation correction.....	286
6.5.3. Application of gains and filters.....	287
6.6. Characteristics of GPR used (The Equipment).....	287
6.7. GPR STUDIES ON THE SITES OF THE CITIES.....	289
6.7.1. GPR profiles in 15 <sup>th</sup> of May city.....	291
6.7.2. GPR profiles in Qattamiya city.....	294
