

AIN SHAMS UNIVERSITY

FACULTY OF ENGINEERING

ELECTRICAL POWER AND MACHINE DEPARTMENT

Power Balance and Control of (UAV)

By

Eng. Karim Nabil Mobariz Hussien

A thesis submitted to the Faculty of Engineering-Ain Shams University in
partial fulfillment of the requirements for the M.Sc. degree in Electrical
Power and Machines Engineering

Under Supervision of

Prof. Dr. Mohamed Abd El-Latif Badr
Electric Power and Machines Department
Faculty of Engineering , Ain shams University

Dr. Mohamed Abd EL-Aziz Hassan
Electric Power and Machines Department
Faculty of Engineering , Ain shams University

Dr. Mohamed Said Sayed Ahmed
Military Technical Collage

Cairo 2010

جامعة عين شمس
كلية الهندسة
قسم هندسة القوى و الآلات الكهربائية

تعريف بمقدم الرسالة

اسم الطالب : كريم نبيل مبارز حسين
الدرجة العلمية الأولى : بكالوريوس الهندسة الكهربيه
الجامعة : الكلية الفنية العسكرية
سنة الحصول على الدرجة : ٢٠٠٤ م
جهة العمل : القوات المسلحة
اسم الجهة : القوات الجوية

Statement

This dissertation is submitted to Ain Shams University for the Degree of M.Sc. in Electrical Power Engineering .

The author has carried out the work included in this thesis at the Department of Electrical Power Engineering, Faculty of Engineering, Ain Shams University.

No part of this thesis has been submitted for a degree or a qualification at any other University or institute.

Name: **Karim Nabil Mobariz Hussien**

Signature:

Date: - - 2010

Dedication

To my father, my mother and my wife.

Acknowledgement

Thanks to Allah before and after, who blessed me with dedicated supervisors, and supported me until the conclusion of this work.

The author is indebted to many people for their advice, assistance and encouragement while advancing in his thesis, especially Professor Dr. Mohamed Abd El Aziz, Associate Prof. of Electrical Power Engineering, Ain Shams University, for his supervision, valuable comments and suggestions.

The author also wishes to express his deepest thanks to Dr. Mohamed Sayed, Assistant Professor of electrical engineering, Military Technical Collage, for his supervision, guidance and assistance throughout the whole thesis.

The author extends his wishes to Professor Dr. Mohamed Abd EL- Lateef Badr, Professor of Electrical Power Engineering, Faculty of Engineering, Ain Shams University for his valuable discussions, guidance, support, encouragement and supervision throughout the course of this research.

Acknowledgment is also extended to all staff members and colleagues in the Automotive Engineering Department, Ain shams university.

Abstract

Unmanned aerial vehicles suffer from inherent instabilities in the pitch axis due to their small size and the lack of pilot feedback. Therefore, a flight control system is needed whose primary function is the artificial stabilization of the aircraft. This system is known as the pitch axis stability augmentation system.

Control augmentation system is a common part of modern airplane control. It is best characterized as a form of tracking control. In this thesis we enhanced the performance of PID controller when applied to the problem of position control. The investigation is based on a permanent magnet DC motor (PMDC) servo system.

Furthermore, the whole power system for the UAV has been designed in such that it would function autonomously. This means that the entire UAV design is autonomous.

This thesis is devoted to the design of an adequate automatic flight control system to stabilize the attitudes and natural modes of a flying fixed wing (Aerosonde) UAV under exogenous disturbances. Towards that objective, a nonlinear mathematical model for the underlying aircraft is developed and linearized yielding a state-space model. Consequently, this linearized model is decoupled into two smaller models associated to the longitudinal and lateral motions of the aircraft. The flight control system is designed to augment both stability and control for an unmanned aerial vehicle called Aerosonde. This control system is designed using Linear Quadratic Gaussian technique. The performance of the control system is compared with the performance of a classical PID controller in terms of input tracking and disturbance rejection properties.

Finally, the design has been experimentally verified using an interface card to control the angle of servo motor. The results of experimental verification of the control system show that LQG technique results in better transient performance than the classical one.

TABLE OF CONTENTS

LIST of TABLES.....	X
LIST OF ABBREVIATIONS.....	XI
LIST OF FIGURES.....	XII
(1) INTRODUCTION	1
1.1 Background	1
1.2 Flight Control System.	2
1.3 Problem Nature.....	4
1.4 Classical Control.....	6
1.5 Advanced Control.....	6
1.5.1 Robust Control	6
1.5.2 Adaptive Control	7
1.5.3 Predictive Control	7
1.5.4 Optimal Control.....	7
1.5.5 Intelligent Control	7
1.6 Aerospace Performance Specification.....	7
1.7 Thesis Outlines	8
(2) UAV MODELING	9
2.1 Introduction	9
2.2 Axes Systems and Rotation.....	10
2.2.1 Earth Axis System	10
2.2.2 Stability Axis System	12
2.3 Aerodynamics Forces and Moments	12
2.3.1 The Equations of Motion of a Rigid Body Aircraft	14
2.3.1.1 Forces and Moments Acting on Aircraft.....	14
2.3.2 External Forces and Moments	18

2.3.2.1 Gravitational and Thrust Forces	18
2.3.2.2 Propulsive Forces and Moments	19
2.4 Reference Frames and Coordinate Transformation.....	19
2.5 Kinematic Equations	22
2.6 Navigation Equations	23
2.7 Flat-Earth, Body axes 6-DOF Equations of Aircraft Motion.....	24
2.8 The Equations Representing the Aircraft Motion	24
2.9 Complete Aircraft Model	26
2.10 Trim and Linearization Model of Aerosonde UAV	28
2.10.1 Small Disturbance	29
2.11 The Equations of Motion in State-Space Form.....	32
2.11.1 The Equations of Longitudinal Motion.....	33
2.12 Controllability and Observability Check.....	37
2.12.1 Condition for Complete State Controllability	37
2.12.2 Condition for Complete State Observability	38
2.13 Controllability and Observability Check for the Aircraft Model Using MATLAB Function.....	38
2.13.1 Controllability Check	38
2.13.2 Observability Check.....	39
2.14 Conclusion.....	39
(3) DYNAMIC MODEL OF A PERMANENT MAGNET DC MOTOR.....	41
3.1 Electrical Characteristics.....	41
3.2 Mechanical Characteristics.....	43
3.3 State Space Representation	44
3.4 Transfer Function Block Diagram.....	45
3.5 The PM DC Motor Parameters.....	47

3.6 Controllability and Observability Check for the PMDC motor Using MATLAB Function.....	48
3.6.1 Controllability Check	48
3.6.2 Observability check.....	49
(4) CONTROLLER DESIGN TECHNIQUES	50
4.1 Classical Control	50
4.1.1 PID Control by Ziegler and Nichols.....	50
4.1.2 PID Control by Genetic Algorithm (GA) Technique	52
4.1.2.1 GA Method Overview	53
4.1.2.2 The Basic Algorithm for GA.....	53
4.1.2.3 The Algorithm	55
4.1.2.4 Population.....	55
4.1.2.5 Fitness.....	55
4.1.2.6 Selection of the Fittest.....	55
4.1.2.7 Crossover.....	56
4.1.2.8 Mutation	56
4.2 LQG Controller	59
4.2.1 LQR.....	60
4.2.2 Kalman Filter.....	61
4.2.3 LQG.....	61
(5) SIMULATION AND RESULTS.....	63
5.1 Open Loop Response.....	63
5.2 SCAS Designing and Simulation Results	65
5.2.1. SCAS Designing by PID	65
5.3 SCAS Designing by LQG	68
5.3.1 LQR Controller.....	68

5.3.2 Kalman Filter.....	69
5.3.3 Prefilter Design.....	70
5.4 Servo Motor Result and Simulation	73
5.4.1 Open loop response of the PMDC Motor.....	73
5.4.2 Closed Loop Response Using PID Controller.....	74
5.4.3 The Response of SCAS PID with Actuator Action.....	75
5.4.4 The Response of SCAS LQG Controller	76
5.5 Conclusions	77
(6) POWER MANAGEMENT AND EXPERIMENTAL WORK	78
6.1 Introduction	78
6.2 UAV's Power Systems.....	83
6.3 Power Autonomation.....	86
6.4 Servos... ..	89
6.5 Servo Controller	92
6.5.1 interfacing using SV203.....	92
6.5.2 Interface Connection using USB Experiment Interface Board K8055.....	96
6.6 Summary	97
