

**Role of Duplex Ultrasonography in Evaluation of  
Complications of Transplanted Kidney**

*Essay*

Submitted for Partial Fulfillment of  
M.Sc. Degree in Radiodiagnosis

*By*

**Ahmed Ateya Ateya Farag**  
*M.B. B.CH. Tanta University*

Under Supervision of

**Dr. Hatem Mohammed Al Azizi**  
*Assistant professor of Radiodiagnosis  
Faculty of Medicine – Cairo University*

**Dr. Abo Al Magd Mohammed Al Bohi**  
*Lecturer of Radiodiagnosis  
Faculty of Medicine – Cairo University*

**Dr. Hussein Saeed Al Fishawy**  
*Lecturer of internal medicine & nephrology  
Faculty of Medicine – Cairo University*

*Faculty of Medicine  
Cairo University  
2012*

بِسْمِ اللَّهِ الرَّحْمَنِ الرَّحِيمِ

قَالُوا سُبْحَانَكَ لَا عِلْمَ لَنَا إِلَّا مَا عَلَّمْتَنَا

إِنَّكَ أَنْتَ الْعَلِيمُ الْحَكِيمُ

صِرَاطَ اللَّهِ الْعَظِيمِ

سورة البقرة (آية 32)

## *Acknowledgement*

*First and foremost, I feel always indebted to Allah, the most kind and the most merciful.*

*I would like to express my deepest gratitude to*

*Dr. **Hatem Mohammed Al Azizi**; Assistant professor of radio diagnosis, faculty of medicine, Cairo university, to whom I owe very much, for planning and supervising this work, for his constructive criticism, and for his close valuable guidance all through this work, I will never be able to express my feeling toward him with simple words, and I wish to be able one day to return to him a part of what he had offered to me.*

*I would also like to express my great thanks and gratitude to*

*Dr. **Abo Al Magd Mohammed Al Bohi** Lecturer of radiodiagnosis, Faculty of Medicine - Cairo university, for his generous help and continuous encouragement. He provided me with valuable comments, knowledge, experience and hand necessary for achieving this work,*

*I am greatly honored to express my deep respect and gratitude to*

*Dr. **Hussein Saeed Al Fishawy** Lecturer of internal medicine & nephrology, Faculty of Medicine - Cairo University, for his faithful supervision, help and encouragement in initiating and completing this work,*

*Lastly but not least, I would like to thank my wife and my family whose continuous encouragement and support have made this work easier to accomplish.*

## Key word

Transitional cell carcinoma

Duplex Ultrasonography

Angiotensin converting enzyme

## Abstract

Complications are numerous and varied include parenchymal insults i.e. vascular occlusion, obstruction, hemorrhage, urinary leak, collections, infection and drug toxicity. Ultrasound is useful in its dual role of not only monitoring transplant dysfunction but also assessing response to therapy. Doppler sonography has been widely used in monitoring renal allograft over the past decade because of its non-invasiveness, convenience and real-time nature. Doppler sonography represents a useful diagnostic tool for detecting vascular complications of renal transplant such as AV fistulas and stenosis or thrombosis of renal vessels.

<b>Table (2):</b>	Indices used in the assessment of renal blood flow .....	66

## List of Diagrams

Diag. No.	Title	Page No.
<b>Diagram (1):</b>	Parameters and formulas for the description of Doppler waveforms .....	69

## List of Abbreviations

Abbrev.	Mean
ACE .....	Angiotensin converting enzyme
AR .....	Acute rejection
AT .....	Acceleration time
ATN .....	Acute tubular necrosis
AVF .....	Arteriovenous fistula
BFAR .....	Blood flow area ratio
BKV .....	Polyoma BK virus
CAN.....	Chronic allograft nephropathy
CR .....	Chronic rejection
EBV .....	Epstein Barr virus
HCB .....	Hypertrophied column of Bertin
IgA.....	Immunoglobulin A
PD .....	Power Doppler
PI .....	Pulsatility index
PRF .....	Pulse repetition frequency
PSV .....	Peak systolic velocity

PTLD ..... Post-transplantation lymphoproliferative disorder

RI..... Resistance index

SD ..... Standard deviation

TAMX ..... Time average mean velocity

TCC..... Transitional cell carcinoma

Tx..... Transplantation

US ..... Ultrasound

UB ..... Urinary bladder

VCU ..... Voiding cysto-urethrography

VUR ..... Vesico-ureteric reflux

### **Introduction**

Continued improvements in graft survival have led to widespread acceptance of renal transplantation as the preferred treatment for the majority of patients with end-stage renal disease. The long-term care of these patients is often provided away from transplantation centers (***Akbar et al., 2005***).

Renal transplantation has established itself as the treatment of choice for the majority of patients with end-stage renal failure. Compared to dialysis it is more cost-effective, produces better survival and allows a more normal lifestyle (***Kabala, 2003***).

The increasing number of renal transplantations and the increased survival rate of renal transplantation patients lead to an increase of the number of complications [vascular, urological, collections] (***Nikolovski et al., 2004***).

An understanding of renal transplant anatomy and the risks of post-transplantation immunosuppressive therapy is essential. In addition, familiarity with the indications and limitations of surgical techniques as well as

## *Introduction & Aim of Work*

---

collaboration between the radiologist and the transplantation surgeon are vital for maximizing the chances of renal allograft survival. Complications of renal transplantation can be diagnosed and managed with minimally invasive techniques (***Kobayashi et al., 2007***).

Ultrasound is unequivocally the most valuable noninvasive imaging modality used in monitoring the renal transplant. Renal transplants are routinely evaluated with sonography as either a component of a screening protocol, or as a work up for renal dysfunction based on a rising serum creatinine level or a decreased urine output (***Muradali & Wilson, 2005***)

Intrarenal CDUS is a noninvasive, accurate diagnostic tool that can be administrated portably and is easily repeatable, thereby making it not only a highly valuable imaging technique but also the method of choice in screening and diagnosing vascular complications of renal transplants (***Gao et al., 2007***)
