# ACKNOWLEDGEMENT

*FIRST OF ALL, I WOULD LIKE TO RAISE MY HANDS AND THANK GOD, WHO HELPED ME AND GAVE ME THE ENERGY AND PATIENCE TO MAKE THIS WORK TO THE END.*

*I WILL ALWAYS BE EXTREMELY GRATEFUL AND THANKFUL TO **PROFESSOR DOCTOR. MONA MOUSTAFA EL-FALAKI** PROFESSOR OF PAEDIATRICS, FACULTY OF MEDICINE, CAIRO UNIVERSITY, FOR THE ATTENTION SHE GAVE TO THIS WORK FROM THE VERY BEGINNING TO THE VERY END OF IT, AND FOR HER SUPPORT, SCIENTIFIC SUPERVISION AND GIVING ALL HER PROFESSIONAL EXPERIENCE THROUGHOUT THE WHOLE WORK.*

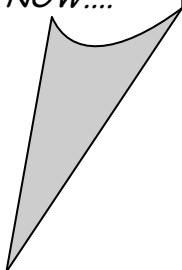

*I WOULD LIKE TO EXPRESS MY SINCERE APPRECIATION AND RESPECT TO **PROF. DOCTOR. MANAL ELMASRY** PROFESSOR OF CLINICAL PATHOLOGY, FACULTY OF MEDICINE, CAIRO UNIVERSITY, FOR HER INSTRUCTIVE GUIDANCE AND GREAT EFFORT.*

*I FEEL GREATLY INDEBTED AND THANKFUL **DR. ALIAA ADEL ALI** ASSISTENT PROFESSOR OF PAEDIATRICS, FACULTY OF MEDICINE, CAIRO UNIVERSITY AND FOR HER GREAT EFFORT, DEEP ASSISTANCE AND CONSTRUCTIVE NOTES THROUGHOUT THIS STUDY.*

*MY THANKS TO OUR PULMONOLGY UNIT STAFF PATIENTS AND NURSES, WITHOUT THEIR ASSISSTANCE THIS WORK WOUDN'T HAVE COME TO THIS RESULT.*

*SPECIAL THANKS AND GRATITUDE ARE EXTENDED TO MY FAMILY AND MY HUSBAND FOR THEIR PRICELESS HELP AND DEEP LOVE.*

*TO MY BELOVED FATHER ....I HOPE YOU ARE PROUD OF ME NOW....  
TILL WE UNITE AGAIN IN A BETTER PLACE.....*

## ***ABSTRACT***

Asthma is the most common chronic inflammatory disease in childhood and some reports have demonstrated systemic inflammation. The relevance of high sensitivity assays for C-reactive protein (Hs-CRP), which are known to be a sensitive marker of low-grade systemic inflammation, has not been fully studied in childhood asthma.

This cross sectional case–control study aimed at evaluating serum Hs-CRP in two groups of asthmatic children, steroid inhaling and steroid naive patients with special emphasis on the relation of measured parameter to different clinical (severity, smoking, family history, other atopic manifestations) and laboratory data (IgE-peripheral blood eosinophil count) and pulmonary function tests. Ninety eight asthmatic Children aged 2yr to 12yr and matched control group of 38 children were recruited for the present study.

The Serum Hs-CRP analysis of patients and controls revealed a non significant statistical difference. The relation between the serum analysis of Hs-CRP in the two asthmatic groups was statistically insignificant.

A statistical significant difference was found between the HsCRP and the result of the pulmonary function tests, but no statistical significant difference was found between HsCRP and asthma severity.

In conclusion HsCRP can be used for indirect detection of airway inflammation, and may be also used to assess response to steroid treatment in asthmatic children but cannot be used as a marker for assessment of different grades of asthma severity.

**Key Words:** Asthma -HsCRP- Severity.

## *Abbreviations*

<b>ACE</b>	Angiotensin-converting enzyme
<b>ACT</b>	Asthma control test
<b>ADRB2</b>	$\beta$ 2 adrenergic receptor
<b>AEC</b>	Absolute Eosinophilic Count
<b>AHR</b>	Airway hyperresponsiveness
<b>ALOX5</b>	5-lipoxygenase
<b>ANOVA</b>	One way analysis of variance
<b>API</b>	Asthma predictive index
<b>ASM</b>	Airway smooth muscle
<b>BA</b>	Bronchial asthma
<b>BHR</b>	Bronchial hyperresponsiveness
<b>BMI</b>	Body mass index
<b>BTPS</b>	Body temperature, barometric pressure and saturated with water vapour conditions
<b>BTS</b>	British Thoracic Society
<b>COPD</b>	Chronic obstructive lung disease
<b>CRP</b>	C-reactive protein
<b>C<sub>rs</sub></b>	Respiratory system compliance
<b>CXR</b>	Chest X-ray
<b>CysLT1</b>	Cysteinyl leukotriene type 1
<b>Da</b>	Dalton : is the standard unit that is used for indicating mass on an atomic or molecular scale (atomic mass)
<b>ECM</b>	Extra cellular matrix
<b>ED</b>	Emergency department
<b>EEL</b>	End expiratory level
<b>EGF</b>	Epidermal growth factor
<b>EIA</b>	Exercise-induced asthma
<b>EPR-3-NAEPP</b>	Expert Panel Report 3 of the National Asthma Education and Prevention Program
<b>ERS</b>	The European Respiratory Society
<b>ETS</b>	Environmental tobacco smoke
<b>Fc<math>\epsilon</math>RI</b>	High-affinity receptor
<b>Fc<math>\gamma</math>R</b>	Immunoglobulin receptors
<b>FEF25-75</b>	Forced expiratory flow between 25% and 75% expired volume
<b>FeNO</b>	Fractional exhaled NO
<b>FEV1</b>	Forced expiratory volume at 1 second
<b>FRC</b>	Functional residual capacity
<b>FRCp</b>	Plethysmographic Functional Residual Capacity
<b>FVC</b>	Forced vital capacity
<b>GERD</b>	Gastroesophageal reflux disease
<b>GINA</b>	Global Initiative for Asthma
<b>GM-CSF</b>	Granulocyte-macrophage colony-stimulating factor
<b>H2O2</b>	Hydrogen peroxide
<b>HRVC</b>	Human rhinovirus C
<b>Hs-CRP</b>	High- sensitive CRP
<b>IC</b>	Immobilized complex
<b>ICAM-1</b>	Intercellular adhesion molecule 1

<b>ICS</b>	Inhaled corticosteroids
<b>IFN-<math>\alpha</math></b>	interferon $\alpha$
<b>IgE</b>	Immunoglobulin E
<b>IgG</b>	Immunoglobulin G
<b>IL</b>	Inteleukin
<b>IL-2</b>	Interleukin -2
<b>IOM</b>	Institute of medicine in Washington
<b>IOS</b>	Impulse oscillometry
<b>ITAM</b>	Immunoreceptor tyrosine-based activation motif
<b>ITIM</b>	Immunoreceptor tyrosine-based inhibition motif
<b>kPa</b>	Kilo Pascal
<b>LABA</b>	Long-acting $\beta$ 2-agonist
<b>LRTIs</b>	Lower respiratory tract infections
<b>LTA4</b>	Leukotriene epoxide hydrolase

## ***Introduction***

Asthma is a heterogeneous and multifactorial disease manifested as episodes of wheezing, coughing, and shortness of breath particularly at night. Both family-based and twin studies indicate that asthma is a complex genetic disorder. Multiple genetic and environmental factors are also known to modulate the clinical expression of the disease and its associated phenotype bronchial hyperresponsiveness, atopy, and elevated IgE (*Patrick et al., 2010*)

Bronchial asthma is prevalent worldwide, especially in developed countries where its prevalence is increasing to epidemic proportions (*Chen and Shi, 2006*).

Asthma comprises a range of heterogeneous phenotypes that differ in presentation, etiology and pathophysiology. The risk factors for each recognized phenotype of asthma include genetic, environmental and host factors. Although a family history of asthma is common, it is neither sufficient nor necessary for the development of asthma (*Burke et al., 2003*).

Asthma is characterised by airway hyperresponsiveness and inflammation, in which various cells (such as eosinophils, neutrophils, macrophages and T-lymphocytes), cytokines and mediators play a role. Beside local inflammation, systemic inflammation is present in asthma, as shown by increased levels of plasma fibrinogen and serum amyloid A (*Jousilahti et al., 2002*). Thus Hs-CRP could theoretically also be a useful tool for detecting systemic inflammation in asthma; indeed, an association between serum hs-CRP level and severity of asthma has been suggested (*Sa˘vykoski et al., 2004*).

Increased Hs-CRP levels may be associated with allergic inflammation, particularly eosinophilic inflammation, and the degree of

airway obstruction in asthmatic patients. It is an important new marker that can help physicians care for asthmatic patients (*Fujita et al., 2007*).

Also, low-level inflammation, as indicated by increased Hs-CRP serum concentrations, has been described in both chronic obstructive pulmonary lung diseases (COPD) and asthma (*Tilemanna et al, 2011*).

In asthma, serum Hs-CRP measurement is noninvasive and easier than measurement in induced sputum or bronchoalveolar lavage fluid. Therefore, Hs-CRP might be a useful clinical marker of eosinophilic airway inflammation in asthma and might assist in the clinical management of the disease (*Fujita et al., 2007*).

## *Aim of work*

The aim of the present study is to evaluate the serum HsCRP levels in two of asthmatic children (group A=steroid inhaling patients; group B=steroid naive asthmatic patients) through a case–controlled study and to assess its correlation to clinical (age, age of onset, sex, duration, severity, asthma control), laboratory (total serum IgE, absolute eosinophilic count) and pulmonary function parameters
