

IMMUNOHISTOCHEMICAL STUDY OF THE EFFECT OF MESOTHERAPY ON SKIN REJUVENATION

Thesis

*Submitted for Partial Fulfillment of Master Degree
In Dermatology, Venereology & Andrology*

Presented by

Maitha Mohammed Al Ahmed

M.B.B.S., Gulf Medical University

Under Supervision of

Prof. Dr. May Hussein El Samahy

*Professor of Dermatology, Venereology & Andrology
Faculty of Medicine, Ain Shams University*

Dr. Ghada Fathy Mohamed

*Assistant Professor of Dermatology, Venereology & Andrology
Faculty of Medicine, Ain Shams University*

Dr. Naglaa Samier Ahmed

*Assistant Professor of Pathology
Faculty of Medicine, Ain Shams University*

Faculty of Medicine, Ain shams University

2013

بِسْمِ اللَّهِ الرَّحْمَنِ الرَّحِيمِ

رَبِّ أَوْزِعْنِي أَنْ أَشْكُرَ نِعْمَتَكَ الَّتِي
أَنْعَمْتَ عَلَيَّ وَعَلَى وَالِدَيَّ وَأَنْ أَعْمَلَ
صَالِحًا تَرْضَاهُ وَأَصْلِحْ لِي فِي دِينِي
إِنِّي تُبْتُ إِلَيْكَ وَإِنِّي مِنَ الْمُسْلِمِينَ

سورة الاحقاف

آية (١٥)

صدق الله العظيم

Acknowledgement

Thanks to **ALLAH** for blessing this work, until it has reached its end, as a part of his generous help, throughout my life.

I can hardly find the words to express my gratitude to **Prof. Dr. May Hussein El Samahy**, Professor of Dermatology, Venereology and Andrology, Faculty of Medicine, Ain Shams University, for her continuous scientific guidance, enriching me with her vast experience, unlimited help and full provision of facilities. It is a great honor to work under her guidance and supervision.

I am greatly indebted to **Dr. Ghada Fathy Mohamed**, Assistant Professor of Dermatology, Venereology & Andrology, Faculty of Medicine-Ain Shams University, for her scientific guidance, helpful cooperation, effective advice and in exhaustible patience throughout the entire work .

I am delighted to express my deep gratitude and sincere thanks to **Dr. Naglaa Samier Ahmed**, Assistant Professor of pathology, Faculty of Medicine-Ain Shams University, for her great help, experienced guidance throughout the period of the work, kind supervision, and the precious time and effort.

Special words of thanks are due to all my professors and all members of the staff of Dermatology and Venereology department, Ain Shams University, for their help and guidance.

I would like to express my sincere gratitude and thanks to my family who always provide me with great support and encouragement.

INTRODUCTION

Skin aging can be attributed to extrinsic aging and intrinsic (chronological) aging and is commonly related to increased wrinkling, sagging, and laxity (*Fisher et al., 1997*).

Extrinsic aging is generally referred to as photoaging and is caused by repeated exposure to ultraviolet (UV) light. Whereas naturally aged skin is smooth, pale, and fine wrinkled, photoaged skin is coarsely wrinkled and associated with dyspigmentation and telangiectasia. Intrinsic skin aging is largely dependent on genetic factors and is associated with increased fragility and loss of elasticity (*Jenkins, 2002*).

Skin aging is associated to an increase of the number and the deepness of wrinkles, a direct consequence of the degradation of macromolecules of the dermis, such as collagens and elastin. In dermis, the matrix metalloproteinase (MMP) overproduction, which occurs in chronological and photo-induced ageing, is stimulated by oxygenated free radicals. Besides, in the skin areas exposed to sun, such as facial skin, other deleterious effects of UV rays occur, in particular an incomplete collagen synthesis, a skin pigmentation, and a solar elastosis (which appears as a degradation of the cutaneous elastic lattice) (*Fisher et al., 1996 and Jenkins, 2002*).

Alterations in collagen, the major structural component of the skin, have been considered to be a cause of skin aging and are observed in naturally aged and photoaged skin (*Gilchrest, 1989 and Varani et al., 2000*). Collagen decrease attributable to natural skin aging may arise from its reduced synthesis and increased degradation, with a concomitant increase of MMP expression. Moreover, in aged sun-protected skin, both the number of fibroblasts and their capacity to synthesize procollagen are reduced compared with young skin (*Varani et al., 2000*).

However, the mechanisms of collagen destruction in aged skin have not been fully clarified. Collagen destruction is, in part, related to the induction of matrix metalloproteinase (MMP) secreted by epidermal keratinocytes and dermal fibroblasts (*Gilchrest, 1989*).

In skin ageing, a disequilibrium occurs in the balance between the synthesis of the extracellular matrix (ECM) and its degradation by MMPs. With increasing age, collagen levels are reduced and MMP secretions increased in sun-protected skin compared with young skin. This disequilibrium leads to an excessive degradation of the extracellular matrix, a characteristic of skin ageing (*Bodemer et al., 2003*). Moreover, in aged sun-protected skin, both the number of fibroblasts and their capacity to

synthesize procollagen are reduced compared with young skin (*Bhupinder, 2010*).

MMP levels are increased by various stimuli, such as UV light, oxidative stress, and cytokines. Collagenases-1 (MMP-1) degrade collagens, while gelatinases A and B (MMP-2 and MMP-9) degrade elastin. Other MMPs, such as stromelysin 1 (MMP-3), are involved both in the collagen and elastin degradation (*Sternlicht and Werb, 2001*).

It is evident that the activity of the MMPs is one of the keys of the skin ageing and that these enzymes have thus to be the target of therapeutic activities (*Philips et al., 2011*).

Mesotherapy is the technique of using microinjections of conventional or homeopathic compounds; for example, vitamins, minerals, or aminoacids, to deliver correction as facial rejuvenation (*Segall, 2007*).

AIM OF THE WORK

The aim of this work was to objectively study the effect induced by rejuvenation mesotherapy of aged skin through histological and immunohistochemical assessment of tissue expression of MMP- 1 and MMP-9.
