

Medical, Surgical and Interventional
Treatment of Cerebral Ischaemia

Essay

*Submitted for Partial Fulfillment of
Master Degree in General Surgery*

Presented by

Hazem Antar Mashaly
M.B., B.Ch. (Ain Shams University)

Supervisors

Prof. Dr. Alaa El-Din Abd El-Hay
Professor and Chairman of Neurosurgery Department
Faculty of Medicine
Ain Shams University

Prof. Dr. Housein Abd El-Alim Boshnak
Professor of General Surgery
Faculty of Medicine
Ain Shams University

Dr. Housein Moharram
Assistant professor of Neurosurgery
Faculty of Medicine
Ain Shams University

Faculty of Medicine
Ain Shams University

2002

Acknowledgement

First and for most, thanks to Allah "The Most Merciful".

I would like to express my deeply felt gratitude to Prof. Dr. Alla El Din Abd El Hay, Professor and Chairman of Neurosurgery Department, Faculty of medicine, Ain Shams University for his continuous guidance, corrections, explanations and support. I wish to be able one day to return to him a part of what he had offered to me.

Thanks for Prof. Dr. Hussin Boshnak, Professor of General Surgery, Faculty of Medicine, Ain Shams University for his continuous help, care and advises. I will never be able to express my feeling towards him by simple words

Special and Great Thanks for Dr. Hussin Moharam, Assist. Professor of Neurosurgery, Faculty of Medicine, Ain Shams University for his constant encouragement, directions, guidance and support.

Great appreciation and Gratitude to all my Professors and Colleagues in the Department of Neurosurgery Department in Ain Shams University.

List of Figures

Figure No....	Page
1 Arteries to brain and meninges	۷
۲ Arteries of brain inferior view	۱۸
۳ Arteries of brain medial view	۲۰
۴ Arteries of brain inferior view	۲۵
۵ The dura mater and venous sinuses	۳۴
۶ Schema of the venous sinuses of the dura mater	۳۶
۷ The cavernous sinuses	۳۸
۸ The sinus at the base of the skull	۳۹
۹ Early CT findings of cerebral infarction.	۶۴
۱۰ HMCAS in CT brain	۶۵
۱۱ Left MCAterritorial infarction in CT brain	۶۵
۱۲ CT patterns of hemispheric infarction	۶۷
۱۳ CT brain showing brain stem infarction	۶۸
۱۴ CT brain showing hemorrhagic transformation of cerebellar infarction with obstructive hydrocephalus	۶۹

10	CT brain showing hemorrhagic infarction	71
17	Diffusion weighted MRI T ₂ and DW-MRI	74
17	MRI showing supacute cerebral ischaemia	77
18	MIR showing cerebral venous thrombosis	78
19	DSA showing large ulceration of a plaque in the carotid bulb, and pseudoaneurysm.	81
20	DSA showing high grade circular stenosis in the ICA with small floating thrombus	82
21	Schemma demonstrating pathway of fibrinolysis	98
22	Vascular shunt used in carotid endarterectomy	114
23	Hemashield patch graft used for carotid repair	117
24	Technique of taking suture in patch angioplasty	120

٢٥	Drawing illustrating the mechanism of PTA	١٤٥
٢٦	DSA showing excellent immediate results of PTA in a patient with severe ulcerated ICA at the bifurcation	١٤٧
٢٧	DSA illustrating the percutaneous transluminal insertion of a stent across a highly calcified internal carotid stenosis at the bifurcation.	١٤٨
٢٨	DSA demonstrating remodeling of the arterial wall after PTA for very severe internal carotid stenosis at the bifurcation.	١٥١
٢٩	DSA showing intra-arterial thrombolysis of MCA occlusion	١٥٨
٣٠	CT and MRI brain showing basilar artery thrombosis	١٥٩
٣١	DSA showing angioplasty following aneurysmal vasospasm in ICA and MCA	١٦٥
٣٢	Severe spasm in distal vertebral and basilar arteries before and after balloon angioplasty treatment	١٦٦

۳۳	Nonenhanced CT scan demonstrating a delta sign	۱۶۷
۳۴	Lateral skull radiograph showing endovascular catheter located in superior sagittal sinus	۱۶۹

VA:	Vertebral Artery

INTRODUCTION

Stroke is the most common cause of death in the world after coronary heart disease and all cancers, causing about 5 million deaths in 1990, three quarters of them in developing countries (*Murry and Lopez, 1994*).

It is the most common life threatening neurological disease (*Warlow, 1994*).

A stroke (previously known as cerebrovascular accident) is rapidly developing clinical symptoms and/or signs of focal, and at times, global loss of brain function with no apparent cause other than that of vascular origin. There is wide range of severity from recovery in a few days, through persistent disability, to death (*Hatano, 1976*).

A transient ischaemic attack (TIA) is an acute loss of focal brain function with symptoms lasting less than 24 hours and which is thought to be due to inadequate cerebral blood supply as a result of arterial thrombosis, embolism or low flow associated with arterial, cardiac or haematological diseases (*Hankey and Warlow, 1994*).

About 80 percent of all first-ever-in-life time strokes are ischaemic, 10 percent are due to primary intracerebral hemorrhage and in the remainder there is uncertainty (*Charles Warlow, 2001*).

Management of cerebral ischaemia includes medical, surgical and interventional measures.

Medical measures include risk factors control, antiplatelets, anticoagulants, and recently thrombolytic agent are used in acute stroke management. Antiplatelet, especially aspirin, has small but definite benefit probably because its antiplatelet action reduces the risk of early recurrent ischaemic stroke (*Charles Warlow, २००१*).

Anticoagulants as heparin are used on assumption that by inhibiting thrombus propagation and recurrent embolization it improves the outcome of stroke (*Charles Warlow २००१*).

Recently intravenous thrombolysis is used for treatment of acute ischaemic stroke. The physiologic and biochemical bases of thrombolytic therapy lies in the ability to affect the pathway of fibrinolysis and conversion of plasminogen into plasmin (*Michael Chicone, १९९१*).

The surgical treatment of cerebral ischaemia include carotid endarterectomy, vertebral endarterectomy, cerebral revascularization and surgery for acute brain infarction with mass effect.

The use of carotid endarterectomy (CEA) in prevention of ischaemic stroke was first described in १९०६. It was never well studied in randomized study until the past decade. Recent cooperative trials have been undertaken to determine the best indications for such procedure.

(Barnett et al., १९९८)

The interventional measure for treatment include percutaneous transluminal angioplasty (PTA) and stenting, and intra-arterial thrombolysis.

Following the favourable results obtained in treatment of coronary artery diseases, combined angioplasty and stenting has been advocated for treatment of carotid stenosis as well. The results of early series have suggested that endoluminal revascularization in high risk patients can be performed with an acceptable degree of safety (*Albuquerque et al., 1998*).

If intra-arterial thrombolysis is proved effective within 6 hours of stroke onset, the landscape of acute stroke treatment should change drastically. Stroke centers with interventional capabilities must be prepared to receive referrals from surrounding hospitals that must select patients likely to benefit from such therapy (*Lawrence, 1999*).

Aim of the Work

The aim of the work is to review the literature on the pathology, clinical features, investigations and to evaluate the different modalities for treatment of cerebral ischaemia which include medical, surgical and interventional measures.

ARTERIAL BLOOD SUPPLY OF THE BRAIN

The brain is supplied by 2 system of arteries:

1. The carotid system of arteries.
2. The vertebrobasilar system.

Carotid System of Arteries

Common Carotid Arteries (CCA)

The right and left carotid arteries differ in length and origin. The right carotid artery is exclusively cervical and it originates from the brachiocephalic trunk behind the right sternoclavicular joint.

The left carotid originates directly from the aortic arch immediately posterolateral to the brachiocephalic trunk and therefore has both thoracic and cervical parts.

Thoracic Part of the Left Common Carotid Artery

This part ascends until the level of the left sternoclavicular joint where it enters the neck. It is 20-25 mm long and it lies at first in front of the trachea, then it inclines to left (*Giorgio Gabella, 1995*).

Cervical Part of Both Common Carotid Arteries

It ascends, diverging laterally from behind the sternoclavicular joint, to the upper border of the thyroid cartilage, where it divides into external and internal carotid arteries. At its division the vessel has a dilatation which is the carotid sinus. Each of these parts is contained in a carotid sheath, continuous with the deep cervical fascia and of loose texture, this sheath encloses also the internal jugular vein and vagus nerve, the vein lies lateral to the artery, the nerve between them and posterior to both (*Giorgio Gabella, 1990*).

External Carotid Artery (ECA)

It begins lateral to the upper border of the thyroid cartilage, at the level of the disc between the third and fourth cervical vertebrae.

It first ascends slightly forward and then inclines backward and a little laterally to pass midway between the mastoid tip and mandibular angle where, in the substance of the parotid gland behind the neck of the mandible, it divides into superficial temporal and maxillary arteries.

Branches:

- | | |
|-------------------------|------------------------|
| 1. Superior thyroid | - Occipital |
| 2. Ascending pharyngeal | - Posterior auricular |
| 3. Lingual | - Superficial temporal |
| 4. Facial | - Maxillary |

(Giorgio Gabella, 1990)

Figure (1): Arteries to brain and meninges

(Frank H. Netter 1997)

Internal Carotid Artery (ICA)

Portions of the internal carotid artery

The internal carotid artery is divided into 4 segments:

- I. Cervical (C_1 portion).
- II. Petrous (C_2 portion)
- III. Intracavernous (C_3 portion)
- IV. Suprachlinoid (C_4 portion)
