

Updates for Anesthetic Management of the Shared Airway

An Essay

**Submitted for Complete Fulfillment of
M.Sc. Degree in Anesthesiology**

By:

Mohamed Abboud Abbas Abou-Zaid
(M.B.B.Ch.)

Supervised by:

Prof. Dr. Hassan Mohamed Ahmed
Professor of Anesthesiology
Faculty of Medicine
Cairo University

Dr. Sahar M. Mostafa El-Shal
Assistant Professor of Anesthesiology
Faculty of Medicine
Cairo University

Dr. Eman Ahmed Fouad Ali
Lecturer of Anesthesiology
Faculty of Medicine
Cairo University

**Faculty of Medicine
Cairo University
2011**

ACKNOWLEDGEMENTS

Thanks to **Allah** for giving me the power and strength to carry out this work.

Words stand short where they come to express my gratefulness to my supervisors.

I would like to express my thanks and deepest gratitude to **Prof. Dr. Hassan Mohamed Ahmed**, Professor of anesthesiology, Faculty of Medicine, Cairo University, for his remarkable effort, help and his continuous guidance which were the major factor behind the completion of this work.

My deep gratitude goes for **Assistant Prof. Dr. Sahar M. Mostafa El-Shal**, Assistant Professor of anesthesiology, Faculty of Medicine, Cairo University, for her kind help and great support throughout this work.

My deep gratitude goes for **Dr. Eman Ahmed Fouad Ali**, Lecturer of anesthesiology, Faculty of Medicine, Cairo University, for her valuable advice.

I would like to express my great thanks to all members of my family especially my mother and father for providing love and care till I finished this work and forever.

DEDICATION

*This work is dedicated to **my great mother, my father and rest of my family** who stood beside me through my entire life and gave me all the support.*

***Dear parents** nothing deserves to be back for your great deed.*

*Thank **you** for everything.*

Abstract

Anesthesia for shared airway surgeries provides an extensive range of challenges for the anesthesiologist and the surgeon, as the complicated nature of these procedures demands nothing less than complete cooperation between these two specialties.

Surgical procedures vary from routine endoscopic examination to complex microsurgery and laser surgery of the larynx, maxillofacial and dental surgery, craniofacial abnormalities and some E.N.T. procedures. The patient population varies from neonates to the elderly.

The anesthesiologist will provide mask anesthetics, spontaneous or jet ventilation, controlled hypotension, and extubations during light levels of anesthesia to avoid postoperative pulmonary complications.

The anesthetic considerations include: dealing with the difficult airway; the risk of obstruction, transaction, disconnection or removal of the airway intra-operatively; the risk of soiling of the airway due to bleeding and surgical debris and the potential for airway compromise post-operatively.

Key word: E.N.T – COX- DMV- NHZ- Polysomnography

μg	Microgram

Introduction

Anesthesia for the shared airway requires close co-operation and communication between the anesthetist and the surgeon for the safety of the patient, a safe airway and an adequate surgical access. The anesthetist needs to maintain a patent airway, ensure adequate oxygenation, carbon dioxide removal and prevent soiling of the bronchial tree, while the surgeon requires adequate access, and -for certain endoscopic procedures- a clear view of a motionless field.¹

Surgical procedures vary from routine endoscopic examination to complex microsurgery and laser surgery of the larynx, maxillofacial and dental surgery have developed with anesthesia, because of the mutual understanding that is necessary for safe and successful surgery on the “shared airway”. Laser airway surgery requires special safety considerations for both operating theatre staff and patients due to the danger of deflected laser radiation and the risk of airway fire.²

Airway management with craniofacial abnormalities is a challenge with many variables. Anesthetist should be familiar with the anatomic and physiologic abnormalities of various craniofacial pathologies, such as cleft palate.³

No ideal universally accepted anesthetic technique exists to cover this wide range of shared airway cases. Anesthetic techniques can be divided into three main groups: First ; intubation techniques requiring the presence of either a small or large cuffed tracheal tube, second; non-intubation techniques include use of the laryngeal mask airway, apnoeic techniques and insufflation techniques and third ; jet ventilation techniques via a supraglottic, subglottic or transtracheal routes.⁴

The anesthetic considerations include: dealing with the difficult airway; the risk of obstruction, transection, disconnection or removal of the airway intra-operatively; the risk of soiling of the airway due to bleeding and surgical debris such as a tooth or bone fragment; and the potential for airway compromise post-operatively. Expired carbon dioxide monitoring "Capnogram" is the best in this situation, as it should indicate disconnection or obstruction whether or not the patient is breathing spontaneously.⁵

The choice of airway management technique is influenced by patient factors, surgical requirements and anesthetic preferences; a cuffed tracheal tube with a throat pack provides the highest level of airway protection in shared airway surgery. Nasal intubation is often used in certain procedures as in surgery on the jaws, teeth, oral cavity and neck, intermaxillary fixation (wiring of the jaws) and assessment of dental occlusion.⁶

The laryngeal mask airway (LMA) has an important role intra-operatively and provides smooth emergence from anesthesia. An elective tracheostomy should be considered if significant post-operative airway compromise is anticipated and may occasionally be necessary under local anesthesia before induction,⁷ also using of flexible fiberoptic bronchoscopy is one of important tools for difficult airway.⁸

A new device was developed to deliver high-frequency jet ventilation via a laryngeal mask airway (LMA) during flexible fiberoptic bronchoscopy in anesthetized patients.⁸

- ***Aim of the work :***

This essay aimed to:

1. Review the anatomy of the airway.
2. Discuss the surgical procedures of the shared airway nature.
3. Discuss the anesthetic management of the shared airway.
