**Thesis Title:-** “*Heat Transfer Enhancement for High Voltage Applications Cooling Using Metal Oxide Nanofluids*”

**Key Words:** *Nanofluid, Nanoparticle, Thermal Conductivity, Electrical Conductivity, Viscosity, Heat Transfer Coefficient.*

### **Summary:**

“The high voltage applications’ cooling uses the double distilled water (DDW) as a cooling fluid because of its low electrical conductivity. This study was performed for enhancing the cooling of the MGC-20 Cyclotron by using the metal oxides nanofluids as a cooling fluid. The aluminum oxide ( $Al_2O_3$ ), copper oxide (CuO) and magnesium oxide (MgO) were used as metal oxides nanoparticles for nanofluids synthesizing to examine the availability of using them as cooling fluids in the MGC-20 cyclotron. The  $Al_2O_3$ , CuO and MgO nanofluids were prepared with different weight concentrations of nanoparticles oxides. The thermal conductivity (TC) of  $Al_2O_3$ , CuO and MgO nanofluids were increased with temperature rising as well as with increase of the oxides concentration in the nanofluid, where the 1.2% wt. CuO nanofluid offered about 16 % increase than the DDW TC at room temperature (RT), then the 1.2% wt.  $Al_2O_3$  nanofluid thermal conductivity increased by 7% and the 1.2% wt. MgO nanofluid increased by 3% at RT. The electrical conductivity was measured for the all nanofluids and it increased with increase of the oxides concentration, as well as with temperature increase. The 1.2%  $Al_2O_3$  nanofluid was the most suitable nanofluid for the high voltage applications and it was tested in a heat transfer system. The overall heat transfer coefficients of the 1.2%  $Al_2O_3$  nanofluid were greater than the double distilled water coefficients at the different flow rates (by about 13%: 17%). So the 1.2% wt. of  $Al_2O_3$  nanofluid could be used for enhancing the cooling process in the high voltage applications especially for the MGC-20 Cyclotron.”

## ACKNOWLEDGEMENT

First, thanks to *Allah*

It is with pleasure and gratitude that I wish to express my acknowledgement to the persons who have contributed with their valuable time, assistance and co-operation for the completeness of this thesis.

The author also expresses his deepest thanks and appreciation to Prof. Dr. Abdallah Hanafi, Mechanical Power Engineering Department, Faculty of Engineering, Cairo University, for his kind supervision, useful guidance, and wise suggestions during this work.

The author would like to express his deep gratitude and special thanks to Prof. Dr. Usama Seddik, Professor of Nuclear physics, Vice Chairman of Egyptian Nuclear and Radiological Regulatory Authority, for his valuable supervision, support, co-operation, helpful guidance, and his great assistance to complete this thesis.

The author is very grateful to Prof. Dr. Mogahed El-Abyad, Director of the Cyclotron Project, Nuclear Physics Department, Nuclear Research Center, Egyptian Atomic Energy Authority, for his co-operation, useful guidance, and wise suggestions during this work.

My deep thanks go to Dr. Ismail Abd El-Rahim, Cyclotron Project, Nuclear Research Center, Egyptian Atomic Energy Authority, for his valuable help during the experimental work.

Many thanks go to the cyclotron staff and my colleagues for their help to finish the experimental work of this thesis.

My endless thanks are due to my family, especially to my mother, for their patience, assistance, and their encouragements all these years.

Finally, my special thanks to my wife and her family for providing me with the suitable environment to perform this work, and their encouragements to finish this work.
