*Giving*

*To my Supporters*

*To my Family*

*To everyone all over the world*

*I hope this Effort will be Useful to Them*

## **ACKNOWLEDGMENT**

*I would like to express my deepest gratitude to my supervision committee. **Prof. Taha Abdel Azim M. A. Razeq** and **Dr. Ahmed Shafik A. El Gendy** for their support, continuous encouragement, helpful advice, and valuable suggestions*

*Sincere appreciation and deep gratitude to **Dr. Farouk Abdel Aziz** for his continuous encouragement and giving all possible help and facilities throughout this work.*

*Deep thanks and gratitude are extended to **Prof. Mohamed Hanafy Mahmoud** Environmental & Infra Structural Studies Cairo University faculty of engineering for his continuous encouragement.*

*Finally, I am deeply grateful and thankful to the great help of my family*

## **ABSTRACT**

Sausage preparation industry consumes large amounts of water in washing the raw and final products also final products that generates large amount of polluted water contains protein which have impact on environment. Pollution aspects related to the sausage preparation industry effluents are characterized by higher concentration of suspended solids. Large volumes of wastewater are generated during the process. Different conventional physicochemical treatments have been used to treat the wastewater. Removal of pollutants produced by industrial plants is required for reuse of water and meet environmental standards. The pollutants in the sausage wastewater have variable concentration of suspended solids, dissolved solids, chemical oxygen demand and Biochemical oxygen demand. This waste water can cause serious environmental problems due to their large amount of suspended solids, and high chemical oxygen demand. So, they have to be removed before being discharged into the environment. Limits for pollutants in wastewater vary depending on the type of receiving water body. The parameters that should be monitored and/or inspected are biochemical oxygen demand BOD, chemical oxygen demand COD, pH, temperature, total suspended solids TSS, and total dissolved solids TDS. The problem of sausage preparation wastewater utilization may be solved with different techniques without reuse or recycle treated wastewater. Different conventional physicochemical treatments have been used to treat the wastewater such as coagulation with mineral coagulants and organic coagulants, then precipitation. Choice of a suitable coagulant to optimize contaminant removal and reduction in costs is the most important factor. The feasibility of using aluminum sulfate, poly aluminum chloride and ferric chloride in sausage wastewater treatment has been investigated. Removal of water pollutants discharged from industrial sausage wastewater is required to comply with the environmental standards. The study was

conducted using poly aluminum chloride dosage (40-140mg/l), ferric chloride dosage (40- 140mg/l) and alum dosage (100 - 600 mg/l) individually. The removal efficiency of COD, BOD, TSS, O&G and TKN recorded (98%), (97%), (97%), (95%), (97%) respectively using a dose of 140 mg/l of PAC. while using a dose 140 mg/l of ferric chloride recorded (96%), (93.5%), (95.5%), (89.4%), (95.4%) respectively and using a dose 600 mg/l of alum recorded (95.6%) (94.3%), (96.5%), (92%), (95%) respectively.

**ABBREVIATIONS:** The following abbreviations are used in this thesis:

Abbreviation	Illustration
BC	Before Christ
BOD	Biochemical oxygen demand
°C	Centigrade
COD	Chemical oxygen demand
EC	Electrical conductivity
m <sup>3</sup> /d	Cubic meter per day
m <sup>3</sup> /m <sup>2</sup> /d	Cubic meter per square meter per day
mg/l	Milligram per liter
DO	Dissolved Oxygen
EEAA	Egyptian Environmental Affairs Agency
PH	Hydrogen Ion Concentration
WTP	West Treatment Plant
WHO	World Health Organization

ml /l	Milliliter per liter
Min	Minute
Ppm	Part per million
R%	Removal percent
rpm	Recycle per minute
RWW	Raw wastewater
SS	Suspended solids
TDS	Total dissolved solids
TS	Total solids
TSS	Total suspended solids
μS/cm	Micro Siemens Per Centimeter
Zp	zeta potential

# **CHAPTER**

## **(1)**

### **1. Introduction**

#### **1.1 Genral**

Meat has been and continues to be a central element of diets in developed countries. Processed meat products (sausages, burgers and meat pies) accounts for almost half of the meat being consumed in these countries. Projections suggest that the global consumption of meat will continue to increase moderately over the next 40 years. This increase reflects the increasing demand for meat and poultry (**Kearney, 2010**). With increasing market demand, meat processors are driven to invest in research and innovation to remain competitive (**Chen et al., 2013**). Meat processors must meet consumer preferences as one of the keys to developing a successful product (**Chen et al., 2013**). There have been rapidly changing consumer demands in the food industry improved health, safety, quality, convenience, value, experience as well as addressing ethical and environmental issues (**Kearney, 2010**).

#### **1.2 Sausage preparation industry**

Sausage preparation industry is one of it and it's very important due to the increasing demand for fast food but it causes heavy pollution. Animal casings are the oldest form of casings used and are considered to have superior moisture vapor transmission and have a wide range of mechanical properties, depending on the type and preparation of the casing (**Savic and Savic , 2002**). The process of casings preparation as follow; pre- washing then washing then filling with water then cutting to same length and sectors then salting. Wastewater can be defined as the remaining spent water that
