Department of Anaesthesia & Intensive care

Awareness and Recall under Anaesthesia

An Essay Submitted For Partial Fulfillment of Master Degree In

Anaesthesiology

By

Ashraf Resmal Adly Fahim

(M.B.B.CH)

Under Supervision Of

Prof.Dr. / Nermín Sadek Nasr

Professor Of Anaesthesia And Intensive Care

Faculty Of Medicine – Ain Shams University

Dr. / Adel Mohamad Al Ansary

Assistant Professor Of Anaesthesia And Intensive Care

Faculty Of Medicine – Ain Shams University

Dr. / Milad Ragaey zekry

Lecturer Of Anaesthesia And Intensive Care

Faculty Of Medicine – Ain Shams University

2013

📖 Arabic Summary	

List of Abbreviation

AAI	A-line ARX Index
AANA	American Association of Nurse Anaesthetists
ACTH.....	AdrenoCorticoTrophic Hormone
AER(P)	Auditory Evoked Response (Potential)
ANOVA	Analysis of Variance
ARX	Autoregressive model with an exogenous input
ASA	American Society of Anaesthesiologists
ASSR	Auditory Steady State Evoked Response
AUC	Area Under the Curve
AVP.....	Arginine Vasopressin
BAER	Brainstem Auditory-Evoked Response
BDZ	Benzodiazepines
BIS	Bispectral Index Scale
BSR	Burst Suppression Ratio
CER	Comparative Effectiveness Research
CNS	Central Nervous System
CPB	Cardiopulmonary Bypass
CS.....	Cesarean Section
CVS.....	Cardiovascular System
DoA.....	Depth of Anaesthesia

ECG	Electrocardiogram
EEG	Electroencephalogram
EMG	Electromyogram
ETT	Endotracheal Tube
FDA	Food and Drug Administration
GA	General Anaesthesia
GH	Growth Hormone
HRV	Heart rate variability
Hz	Hertz (cycle/sec)
ID	Identification
IDT	Induction to Delivery Time
IV	Intravenous
JCAHO	Joint Commission on Accreditation of Health Care Organization
LTM	Long Time Memory
MAC	Minimum Alveolar Concentration
MIC	Monitor Interface Cable
MLAER	Middle Latency Auditory Evoked Response
N ₂ O	Nitrous Oxide
P value	Propability value
PACU	Post Anaesthesia Care Unit
PET	Positron Emission Tomography
PIC	Patient Interface Cable

PSA	Patient State Analyzer
PSI	Patient state Index
PTSD	Post Traumatic Stress Disorder
RE	Response Entropy
SD	Standard Deviation
SE	State Entropy
SEF	Spectral Edge Frequency
SEMG	Spontaneous Surface Electromyogram
SLOC	Spontaneous Lower Oesophageal Contractility
SPSS	Statistical Package for Social Sciences
SQI	Signal Quality Indicator
SSER	Somatosensory Evoked Response
STM	Short Time Memory
TIVA	Total Intravenous Anaesthesia
UDT	Uterine incision to Delivery Time
US	United States
USB	Universal Serial Bus
VER	Visual Evoked Responses

Acknowledgment

First of all, thanks to GOD who supported and helped me to accomplish this work as a part of His generous help and support throughout of my life.

I would like to express my special thanks and deep appreciation to Prof. Dr. Nermin Sadek Naser, Professor of Anaesthesia and Intensive care, Faculty of Medicine, Ain Shams University for her great help and support at the beginning of this work. I wish I could have the honor to work under her supervision. GOD bless her soul.

I would like to express my sincere appreciation and deep gratitude to Prof. Dr. Adel Mohamed Al Ansary, Professor of Anaesthesia and Intensive care, Faculty of Medicine, Ain Shams University for his kind supervision, encouragement and great support throughout the whole work.

I am very grateful to Dr. Milad Ragaey Zekry, Lecturer of Anaesthesia and Intensive care, Faculty of Medicine, Ain Shams University for his continuous help and the tremendous effort he had done in the meticulous revision of this work.

At last, I am indebted for my family for their great support, patience, and continuous encouragement.

Ashraf Reşmal

Introduction

Memory is not a single entity, recent classifications distinguish between two types: Explicit, or conscious memory, and implicit, or unconscious memory.

Explicit memory refers to the conscious collection of previous experiences. Implicit memory by contrast, refers to changes in performance or behavior that are produced by previous experiences but without any conscious recollection of those experience (**Ghoneim, 2000**)

The term "awareness" during anesthesia, as used in the anesthesia literature, implies that during a period of intended general anesthesia, the brain is aroused by stimuli that are stored in memory for future explicit recall. Patients who experience awareness will recall such experiences during a state of inadequate anesthesia (*Ghoneimet al, 2009*).

The incidence of awareness in nonobestetric, and noncadiac surgical cases is 0.2%. Yet it may be greater if light anesthesia is used. The incidence in obstetric cases is 0.4%, a higher incidence also has been reported for cardiac cases (ranges from 1.1-1.5%),

and major trauma cases (11-43%). This incidence varies according to the dose of anesthetic administered (*Ghoneim et al , 2009*), (*Rampersad&Mulroy, 2005*).

Aim of the work

The aim of the work is to throw light on types, risk factors and complications of Awareness under anaesthesia and discuss what might be done to manage it.

Physiology of memory

Definition of Memory:

Memory is one of the activities of the human mind, much studied by cognitive psychology. It is the capacity to retain an impression of past experiences. It was defined by *Lefrancois (1995)* as the availability of information and the ability to retrieve it and the previously acquired skills.

Memory is also defined as a set of active processes that encode and store information and rearrange it with related items which have already been stored in memory, so that it is easier to remember and can be located and retrieved whenever needed (*Thompson and Kim, 1996*).

So the main stages in the formation and retrieval of memory, are:

- **Encoding** (processing and combination of received information)
-

- **Storage** (creation of a permanent record of the encoded information)
- **Retrieval** (calling back the stored information in response to some cue for use in some process or activity) (*Thompson and Kim, 1996*).

Models of Memory:

The concept of **memory** has generated the construction of many models in attempt to explain, understand and interpret its functions (*Thompson and Kim, 1996*).

A. Atkinson and Shiffrin Model of Memory (Multi-Store Model or Multi-Memory Model):

In *1968*, *Atkinson and Shiffrin* proposed a model of human memory (**figure1**) which presented two distinct memory stores: **short-term memory (STM)**, and **long-term memory (LTM)**. Later a third memory store (actually the first in sequence) was added; **the sensory memory**. Here are some of the characteristics of each memory system:

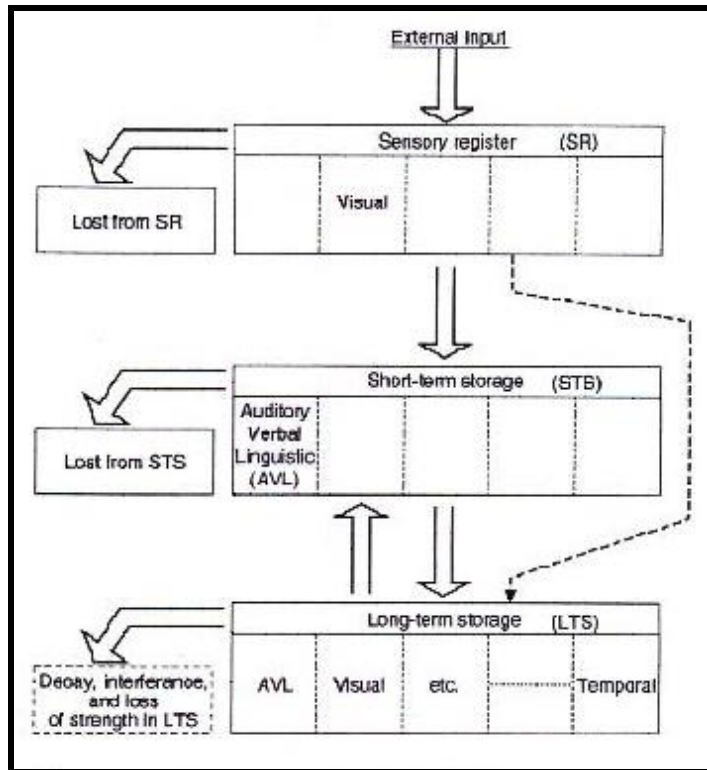

Figure (1): Atkinson-Shiffrin model of memory. External stimuli enter the sensory memory, of which a portion is transferred into the STM. Small amount of the information then enters into the LTM of which the STM refers back to and expands on when needed (*Atkinson and Shiffrin, 1968*).
