## Body Mass Index and Infertility among Egyptian Women

Abstract

By

Mona Mohamed Ebrahim

The aim of this correlational study was to explain the relationship between body mass index (BMI) and infertility rate among Egyptian women. A total of 300 married women diagnosed as primary or secondary infertility, and attending the Out patient Infertility Clinic at El Manial University Hospital, Cairo University, Egypt; and in a private clinic were recruited for the study. Data were collected through an interviewing questionnaire schedule with anthropometric assessment. The study results indicated that the mean age of the sample was  $28.62 \pm 6.32$  years, while their mean age at marriage was  $25.99 \pm 7.53$  years, and the mean of duration of infertility was  $4.324 \pm 3.550$  years. Fifty-seven percent of the sample had primary infertility, while 43% had secondary infertility. Sixty-one percent of the sample had irregular menstruation, and 40.7% of them had menstrual abnormalities. Seventy-nine point seven percent of the sample had history of gynecological disease, 36.3% of them had polycystic ovary, while 32.2% of them had cervicitis. Forty two point six percent of the sample used different types of contraceptives and more than half of them used intrauterine device (IUD). Fifty-seven point three percent of the sample had snacks between meals, 42.3% of the sample were depending on fatty saturated diet. Sixteen point seven percent of the sample had sexual problems. The mean of body mass index was  $29.3 \pm 6.306$ , and more than two thirds of the sample were overweight and obese (33.3, & 35% respectively). The results indicated that age of the woman, age and years of marriage, BMI, eating snacks between meals, fatty saturated diet, history of polycystic ovary, and cervicitis, use of contraceptives, history of complications during pregnancy, labor and postpartum periods, mode of previous delivery and frequency of sexual intercourse/week were predictor variables that might affect the incidence of infertility. The study concluded that, women with the following profile: older age at marriage, overweight and obese ( $BMI \geq 30 \text{Kg/m}^2$ ), depending on fatty saturated diet, eating snacks, having history of polycystic ovarian syndromes, having cervicitis, long use of contraceptive methods, having frequent sexual intercourse might be contributing factors that affect incidence of female infertility. The main study recommendations are: teaching women during childbearing period about predisposing factors of infertility and importance of regular screening in early detection of these factors; raising women's awareness regarding to adopting a healthy life style through following dietary program and practicing exercise. Further studies are recommended regarding: the relation between infertility and underweight; and infertility and use of chemical douching.

## ACKNOWLEDGEMENT

First and foremost, I feel always indebted to ALLAH, the kindest and the most merciful for enabling me to accomplish this work.

I would like to express my gratitude and greatest indebtedness to **Prof. Dr. Shadia A. Hassan**, Vice Dean of Postgraduate Studies and Research, and Professor of Maternity and Newborn Health Nursing, Faculty of Nursing, Cairo University, for her valuable time, untiring effort, continuous guidance, and encouragement to accomplish this work.

I would like to express my Special thanks to **Prof. Dr. Yousria A. El Sayed**, Professor of Maternity and Newborn Health Nursing, Faculty of Nursing, Cairo University, for her guidance and helping me to accomplish the first part of this work (thesis protocol), and designing tool for data collection.

Sincere appreciation and thanks to **Prof. Dr. Gamal G. Youssef**, Professor of Obstetrics and Gynecology, Faculty of Medicine, Cairo University, who devoted great deal of his valuable time, untiring effort, continuous guidance, support, and encouragement to elaborate this work.

I would like to express my sincere appreciation to **Dr. Hanan F. Azzam**, Lecturer of Maternity and Newborn Health Nursing, Faculty of Nursing, Cairo University, for her supervision, support, faithful guidance, and continuous encouragement to complete this work.

Special thanks to all women who participated actively in this study and being appreciative and very co-operative, and tolerated me till the accomplishment of this work.

I would like to have this opportunity to express my greatest appreciation to all those who directly or indirectly assisted me in the completion of this thesis.

I am deeply indebted with thankfulness and gratitude to my dear family and friends for their support, encouragement, and tolerance.

Last but not the least; I would like to express my endless gratitude to my teachers, colleagues in the Maternity and Newborn Health Nursing Department, and in the Faculty for their continuous support, help and cooperation to accomplish this work.

The candidate

*Mona M. Ebrahim*
