ACKNOWLEDGEMENT

Acknowledgment

First and foremost, I feel always indebted to Allah the most Merciful the most Gracious. Thanks to Allah who has lightened my path to become a humbled student of a noble profession and granted me the ability to accomplish this work.

I would like to express my sincere thanks and deep appreciation to Prof. Dr. Mervat Ahmed Haroun, Professor of Pediatrics; Cairo University; for her motherly support and giving me the opportunity to research in the field of my own interest. My deep feeling of gratitude goes to her for close supervision, constructive guidance and meticulous revision of the essay.

I am profoundly grateful to Ass. Prof. Dr. Ismail Mohamed Bahie El Din Elhawary; Assistant Professor of Pediatrics; Cairo University; for his guidance, valuable comments and careful supervision.

My sincere thanks go to Dr. May Ahmed Khairy Abdel Latif, Lecturer of Pediatrics; Cairo University; for her kind supervision, tremendous support and faithful guidance.

I would like to express my deepest gratitude and heartily thanks to Prof. Dr. Rabah Mohamed Shawky, Professor of Pediatrics and Genetics; Ain Shams University; the first one taught me what genetics mean.

I also wish to thank Prof. Dr. Safia Effat, Professor of Neuropsychiatry; Ain Shams University; for her invaluable assistance and supply of recent literature.

I am forever grateful to all My Professors and Colleagues. I owe them very much for their constant support, advice, and encouragement throughout my work.

Last but not least, no words ever spoken can express my feeling of admiration, love and extreme thanks to My Family. Without their help, support and sacrifice, this work could not have seen light.

Abstract

Autistic disorder (AD) is a pervasive developmental disorder beginning before the age of 3 ys and lasting over the whole life time. It is characterized by a triad deficit: qualitative impairments in social interactions, communication deficits & repetitive and stereotyped pattern of behavior. Recent studies show prevalence rates ranging from 10 to 20 per 10,000. Although the etiology of AD is unknown, genetic predisposition is evident from family and twin studies, and heritability is estimated over 90%. The genetic component is best described by a multilocus model that takes into account epistatic interactions between several susceptibility genes. To date, suggestive autism susceptibility loci have been identified on almost every chromosome.

Key Words: Autistic Disorder (AD); Candidate genes;
Cytogenic Regions of Interest (CROI);
Linkage; Association; Genome Scan;
Multifactorial Inheritance.
