بِسْمِ اللَّهِ الرَّحْمَنِ الرَّحِيمِ

اللَّهُ لَا إِلَهَ إِلَّا هُوَ الْحَيُّ الْقَيُّومُ

لَا تَأْخُذُهُ سِنَةٌ وَلَا نَوْمٌ لَهُ مَا فِي السَّمَوَاتِ وَمَا فِي الْأَرْضِ مَنْ ذَا الَّذِي يَشْفَعُ عِنْدَهُ
إِلَّا بِإِذْنِهِ يَعْلَمُ مَا بَيْنَ أَيْدِيهِمْ وَمَا خَلْفَهُمْ وَلَا يُحِيطُونَ بِشَيْءٍ مِنْ عِلْمِهِ إِلَّا بِمَا شَاءَ
وَسِعَ كُرْسِيُّهُ السَّمَوَاتِ وَالْأَرْضَ وَلَا يَئُودُهُ حِفْظُهُمَا وَهُوَ الْعَلِيُّ الْعَظِيمُ

Statement

This thesis is submitted to Ain Shams University in partial fulfillment of the degree of Master of Science in Electrical Engineering.

The work in this thesis was carried out by the author at the department of Electronics and Communications Engineering, Faculty of Engineering, Ain Shams University, Cairo, Egypt.

No part of this thesis has been submitted for a degree or a qualification at any other university or institute.

Name : Mohamed Emam Mohamed Fathy

Curriculum Vitae

Name of the researcher	Mohamed Emam Mohamed Fathy
Date of Birth	13 rd of August 1985
Place of Birth	Cairo, Egypt
First University Degree	B.Sc. in Electrical Engineering, Electronics and Communications Department, Faculty of Engineering, Ain-Shams University.
Date of Degree	June 2007
Current Job	RF Engineer at Ericsson

Abstract

With the deployment of the Home eNodeB, the handover between femtocell and 3GPP macrocell networks is becoming more important in LTE based networks. Thousands of femtocells within a macrocell area will create a large neighbor cell list and an interference problem. Thus modifications of handover procedure and algorithm for existing networks are needed to improve the performance of both the femtocell and LTE networks

The novel handover mechanism proposed in this thesis will have a better performance in the rate of decreasing the signaling load on the core network by making the node of HeNB GW a more intelligent node. Introducing the concept of FFR (fractional frequency reuse) in our proposition will improve the interference problem between the macrocell and its neighbors of femtocells. This will enhance the data throughput. Also the concepts of ANR (automatic neighbor relations) and DNL (dynamic neighbor list) and their roles in solving the problem of defining the neighbors for the macrocell, taking into consideration the limited number of neighbors that should be defined for each macrocell. So this will give the femtocell the advantage of dynamism

On the other hand, introducing a simple analytical model to compare between the standard architecture and proposed one. This gives a proof of the importance of the proposed architecture and how the introducing of both (Intelligent HeNB GW) and (X_2 Handover instead of S_1 Handover) will enhance in performance improvement. Finally, a detailed and optimized algorithm for the handover scenario from macrocell to femtocell has been showed.

Acknowledgment

In the name of Allah, the Most Gracious and the Most Merciful

Alhamdulillah, all praises to Allah for the strengths and his blessing in completing this thesis.

Special appreciation goes to my supervisor, Prof. Dr Adel Ezzat Mohamed El-Hennawy, Electronics and Communications Department, Ain Shams University, for his supervision, encouragement and constant support. His invaluable help of constructive comments and suggestions have contributed to the success of this research.

I express my deepest gratitude and thanks to Dr. Mirette Mahmoud Sadek, Assistant Professor, Electronics and Communications Department, Ain Shams University, for her continuous supervision, support and actually she is behind all analytical, technical and even spiritual actions throughout this work. Without her encouragement, the thesis could not reach this level.

Also my deepest gratitude and sincerest thanks to my beloved parents and brother for their endless love, prayers and encouragement

Also, I will not forget my deceased sister Hanan, she always encouraged me. Really I miss her and I wish to be with us now to see how her support and interest with me, reach me to this level. I ask Allah for her to be in Paradise now.

Last, but not least thanks, to my fiancée Amira, who did all her best for me and always encourages for further progress.

List of Figures

1.1	Approximate timeline of the mobile communications standards landscape.....	1
2.1	Spectral efficiency of OFDM compared to classical multicarrier modulation.....	7
2.2	FDM carriers are placed to next to each other.....	8
2.3	A bit stream that will be modulated using a 4 carrier OFDM.....	9
2.4	Sub-carrier 1 and the bits it is modulating (the first column of Table I)...	10
2.5	Sub-carrier 2 and the bits that it is modulating (the 2 nd column of Table I).....	10
2.6	Sub-carrier 3 and 4 and the bits that they modulating (the 3 rd and 4 th columns of Table I).....	11
2.7	OFDM signal in time and frequency domain.....	11
2.8	Functional diagram of an OFDM signal creation. The outlined part is often called an IFFT block.....	12
2.9	The generated OFDM signal, Note how much it varies compared to the underlying constant amplitude sub-carriers.....	12
2.10	The two views of a signal.....	13
2.11	FFT and IFFT are a matched linear pair.....	15
2.12	The incoming block of bits can be seen as a four bin spectrum, The IFFT converts this “spectrum” to a time domain OFDM signal for one symbol, which actually has four bits in it.....	15
2.13	The OFDM link functions.....	16
2.14	Fading is big problem for signals. The signal is lost and demodulation must have a way of dealing with it. Fading is particular problem when the link path is changing, such as for a moving car or inside a building or in a populated urban area with tall building.....	16
2.15	Reflected signals arrive at a delayed time period and interfere with the main line of sight signal, if there is one, in pure Raleigh fading, we have no main signal, and all components are reflected.....	17
2.16	(a) The signal we want to send and the channel frequency response are well matched. (b) A fading channel has frequencies that do not allow anything to pass. Data is lost sporadically. (c) With OFDM, where we	

have many little sub-carriers, only a small sub-set of the data is lost due to fading.....	18
2.17 Time dispersion and corresponding received-signal timing.....	19
2.18 The PSK symbol and its delayed version(a) The delayed, attenuated signal and (b) composite interference.....	19
2.19 Move the symbol back so the arriving delayed signal peters out in the gray region. No interference to the next symbol.....	19
2.20 The extension of the symbol and the corruption due to splash.....	20
2.21 If we move the symbol back and just put in convenient filler in this area, then not only we have a continuous signal but one that can get corrupted and we don't care since we will just cut it out anyway before demodulating.....	20
2.22 Cyclic prefix is this superfluous bit of signal we add to the front of our precious cargo, the symbol.....	21
2.23 The whole process can be done only once to the OFDM signal, rather than doing it to each and every sub-carrier.....	21
2.24 Addition of Cyclic prefix to the OFDM signal further improves its ability to deal with fading and interference.....	21
2.25 The spectrum of an OFDM signal (without addition of cyclic prefix) is much more bandwidth efficient than QPSK.....	22
2.26 The spectrum of an OFDM signal with 1024 sub-carriers.....	23
2.27 The spectrum of a QPSK signal.....	23
2.28 AN OFDM signal is very noise like. It looks just like a composite multi-FDM signal.....	24
2.29 FFT trigger point specified for symbol 2 (a) beginning of range (b) End of range.....	25
2.30 Effect of frequency offset.....	26
2.31 OFDMA scheme: (a) downlink and (b) uplink [2].....	27
3.1 The EPS network elements.....	29

3.2	Functional split between E-UTRAN and EPC.....	30
3.3	Overall E-UTRAN architecture.....	33
3.4	S1-MME control plane protocol stack.....	34
3.5	S1-U user plane protocol stack.....	35
3.6	S1-based handover procedure.....	36
3.7	X2 signaling bearer protocol stack.....	37
3.8	Transport network layer for data streams over X2.....	37
3.9	X2-based handover procedure.....	38
3.10	Downlink channel-dependent scheduling in time and frequency domains.....	41
3.11	Example of inter-cell interference coordination, where parts of the spectrum is restricted in terms of transmission power.....	42
3.12	FDD vs. TDD, FDD: Frequency Division Duplex; TDD: Time Division Duplex; DL: Downlink; UL: Uplink.....	44
3.13	LTE protocol architecture (downlink).....	45
3.14	Example of mapping of logical channels to transport channels.....	47
3.15	Frame structure type 1.....	48
3.16	Mapping between downlink transport channels and downlink physical channels.....	49
3.17	Mapping between uplink transport channels and uplink physical channels.....	49
3.18	LTE downlink transport-channel processing. Dashed parts are only present in case of downlink spatial multiplexing, that is when two transport blocks are transmitted in parallel within a TTI.....	50
3.19	Downlink CRC insertion, calculating and appending a CRC to each transport block.....	51
