

CYSTIC NEOPLASMS OF THE PANCREAS CLINICO-PATHOLOGICAL STUDY

Thesis

Submitted for Complete Fulfilment of
The Master Degree (M.Sc.) in
Surgical oncology

By

HANY MOHAMED ELHAMY NADA
M.B., B.Ch.

Supervised By

Prof. Mohammed Gameel Abdel Moneam

*Professor of Surgical Oncology,
National Cancer Institute,
Cairo University*

Prof. Ismail Morad Abdel Moneam

*Assistant Professor of Surgical Oncology,
National Cancer Institute,
Cairo University*

Dr. Samy Ramzy Shehata

*Assistant Professor of Surgical Oncology,
National Cancer Institute,
Cairo University*

**NATIONAL CANCER INSTITUTE
CAIRO UNIVERSITY**

2009

بسم الله الرحمن الرحيم

ACKNOWLEDGEMENT

“First and foremost, thanks are due to God”

*I would like to express my deepest gratitude and sincerest thanks to Professor **Dr. MOHAMMED GAMEEL ABDEL MONEAM**, Professor of Surgical Oncology, National Cancer Institute, Cairo University, for his useful and keen supervision, fatherly guidance and giving me honour to work under his supervision.*

*I would like to express my immense gratitude and appreciation to my kind Professor **Dr. ISMAIL ABDEL MONEAM MORAD**, Assistant Professor of Surgical Oncology, National Cancer Institute, Cairo University, and Assistant Professor **Dr. SAMY RAMZY SHEHATA**, Assistant Professor of Surgical Oncology, National Cancer Institute, Cairo University, for the benefit of their extensive experience and knowledge.*

*I also acknowledge the help and guidance which I received from **Dr. Tarek El Baradie** lecturer of surgical oncology, National cancer institute and **Dr. Hesham Khalifa** lecturer of surgical oncology, National cancer institute for their great help in the practical part of the work and following the work to insure its valuable level.*

Last, but not least, I would like to express my deepest gratitude to the assistance of several People without whose help I wouldn't have been able to Complete this project .

Hany Nada
May 2009

TO MY PARENTS
TO WHOM I OWED MY DEEPEST GRATITUDE
MY SISTER
MY FRIENDS
&
My dearest Wife

ABSTRACT

Primary cystic neoplasms of the pancreas are rare neoplasms, comprising about 10–15% of all pancreatic cystic masses and only 1% of primary pancreatic lesions of unknown origin. The importance of identifying those neoplasms became clear because of their latent or overt malignant potential.

In this study, a total of 34 patients were identified who underwent operative therapy for pancreatic cystic neoplasms in the National Cancer Institute from 2002 till 2008. The most frequent presentation was found to be upper abdominal pain and abdominal mass, the surgical management for patients was mainly distal pancreatectomy due to the prevalence of distal pancreatic tumors, Whipple's procedure and triple bypass were also done.

The main pathology was solid cystic pseudopapillary tumor followed by mucinous cystadenocarcinoma. Mucinous cystic neoplasm, Intraductal mucinous neoplasm and serous adenoma were also present. Follow up of the patients ranged from one to four years, where three patients had liver metastasis, only two of those had adjuvant chemotherapy.

Key words: Cystic neoplasms, Intraductal papillary mucinous neoplasm, mucinous cystic neoplasm, pancreas, serous cystic neoplasm, solid pseudopapillary neoplasm.

**INTRODUCTION
AND
AIM OF THE WORK**

INTRODUCTION

Cystic lesions of the pancreas have long posed diagnostic and treatment dilemmas to surgeons and patients. While many identified lesions may prove to be inflammatory pseudocysts or other benign conditions, the possibility of malignancy within a cystic lesion necessitates a thorough diagnostic work-up. Technical advances in radiology, advances in pathology and surgery have led to a recent re-classification of cystic neoplasms of the pancreas (*Christopher .Sonnenday et al., 2007*).

Cystic neoplasms comprise only about 10% of all pancreatic cystic lesions; since most of the latter are pancreatic pseudo cysts (*Fernandez-del Castillo et al., 1995*), (*Matsunou , Konishif, Yamamichi , et al., 1990*).

They also comprise 1-10% of all pancreatic neoplasms (*LI et al., 1998*), (*Fernandez-del Castillo et al., 1995*). Cystic neoplasms of the pancreas are classified histologically as benign, also known as microcystic (serous cystadenoma), and potentially malignant, also known as macrocystic (mucinous cystic neoplasm) (*COMPAGNO et al., 1998*), (*COMPAGNO et al., 1990*). Other uncommon types of pancreatic cystic neoplasms include intraductal papillary-mucinous neoplasm, papillary cystic neoplasm, endocrine cystic tumor, cystic teratoma, and acinar cystadenocarcinoma (*LI et al., 1998*).

The Advances in radiology, pathology, gastroenterology, and surgery have led to a recent consideration of the classification of cystic neoplasms of the pancreas, reflecting an improved understanding of diagnosis, prognosis, and treatment of these often challenging lesions.

While a large number of pancreatic cystic neoplasms may have gone undetected, the increased use of high resolution cross-sectional imaging, particularly computed tomography (CT), and high quality magnetic resonance imaging (MRI), has led to increased discovery of cystic lesions of the pancreas as a clinical entity (*Fernandez-del Castillo et al., 2003*).

The treatment of pancreatic cystic neoplasms is still controversial. Most authors, however, recommend resection due to the difficulties in differentiating benign from malignant tumors prior to surgery (*Balcon IV et al., 2000*).

Unlike invasive ductal adenocarcinoma of the pancreas, many of cystic neoplasms of the pancreas have quite favorable prognosis following surgical resection, even when invasive cancer is encountered.

AIM OF THE WORK

The aim of this study is to highlight the clinico-pathological presentation of the cystic neoplasms of the pancreas, with emphasis on the role of surgical management and its outcome. This was done through reviewing the medical records of patients of cystic neoplasms of the pancreas subjected to surgical management in the period from January 2002 till December 2008. Data collected included clinical, radiological and pathological data, investigation done surgical procedure, adjuvant therapy, if present, and follow up.

REVIEW OF LITERATURE

ANATOMICAL CONSIDERATIONS

When discussing the surgical anatomy of the pancreas our aim is to review the most important anatomical aspects that aid the surgeon in resection. When dealing with limited pancreatic resection especially in patients with low malignant potential tumors, review of the embryology, anatomy of the ductal system, vascular anatomy and radiological anatomy is essential.
