

STUDY OF IN HOSPITAL COURSE OF ACUTE CORONARY SYNDROME AMONG YOUNG EGYPTIAN PATIENTS

Protocol of thesis

Submitted For Partial Fulfillment Of Master Degree In Cardiology

BY

SHERIF FAROUK BEBAWY

M.B.B.Ch

Ain Shams university

UNDER SUPERVISION OF

PROF.DR.AMAL MOHAMED EL SAYED AYOUB

Professor Of Cardiology

Faculty Of Medicine

Ain Shams University

DR. HANY IBRAHIM RAGY

Consultant Of Cardiology

National Heart Institute

DR.IMAN ESMAT IBRAHIM

Assistant Professor Of Cardiology

Faculty Of Medicine

Ain Shams University

Faculty Of Medicine

Ain Shams University

2013

*Thanks to **God** who helped me to accomplish this work*

My deepest and warmest gratitude to my great supervisor Prof. Dr. Amal Mohamed El Sayed, Professor of Cardiology, Faculty of Medicine, Ain Shams University, who in addition to her valuable guidance and supervision, has provided me with a great deal of support, encouragement and Knowledge.

I would like to express my great appreciation and thanks to Dr. Iman Essmat Ibrahim, Assistant Professor of Cardiology, Faculty of Medicine, Ain Shams University. It was a honor to me to carry out this work under her continuous guidance, encouragement and expert supervision.

I'm also deeply indebted to Dr. Hany Ibrahim Ragy and Dr. Mohamed Selim for supporting and healing in every step of this work.

My special thanks are dedicated to my Family for their endless support to me, and for pushing me forward all the time.

Sherif Farouk

STEMI..... ST segment elevation myocardial infarction
SWMSI.....segmental wall motion score index
TIMI..... Thrombolysis in myocardial infarction
UFH..... Unfractionated heparin
URL.....upper reference limit

Introduction

Acute coronary syndrome (ACS), encompassing a range of disorders from unstable angina through non ST elevation to ST elevation myocardial infarction, is a leading cause of death in the world in both developed and developing countries (*Reddy KS et al., 2004*).

There are also limited data on the frequency of myocardial infarction (MI) in younger subjects. In the Framingham Heart Study, the incidence of an MI over a 10 year follow-up was 12.9/1000 in men 30 to 34 years old and 5.2/1000 in women 35 to 44 years old (*Kannel et al., 1984*).

The incidence of MI was eight to nine times greater in men and women aged 55 to 64 years. In other studies, 4 to 10 percent of patients with MI were ≤ 40 or 45 years of age (*Doughty, 2002*).

The prevalence of coronary heart disease (CHD) in younger subjects is difficult to establish accurately since it is frequently a silent process. The frequency with which this occurs was examined in an autopsy study of 760 young (age 15 to 34 years) victims of accidents, suicides, or homicides (*McGill et al., 2000*).

Despite the large and expanding elderly population presenting for ACS care, existing evidence is limited and

insufficient to guide management in this subgroup, to the same degree of certainty as in younger populations (*Alexander KP et al., 2007*).

In two series of patients with CHD at ≤ 40 years of age, women comprised 5.6 and 11.4 percent of patients (*Cole et al., 2003*).

Registries and surveys have the potential to define the ‘gaps’ between evidence and practice as well as implementation of guidelines (*Bassand et al., 2005*).

Aim of the Work

1. To study the demographic details of the young patients below 40 years old presenting with acute coronary syndrome.
2. To assess clinical, angiographic profile and interventional outcome in young patients below 40 years old with ACS during hospital admission.

ACS and definition of Myocardial infarction

Acute coronary syndrome encompasses a spectrum of coronary artery diseases, including unstable angina, STEMI, and non-STEMI (*Suraj et al., 2005*).

According to WHO's definition, a myocardial infarction occurs if at least two of three criteria are fulfilled:

1. Typical ischemic chest pain.
2. Raised concentrations of serum Creatine kinase-MB.
3. Typical electrocardiographic findings, including development of pathological Q-waves (*Tunstall-Pedoe, 2001*).

However, Creatine Kinase-MB is not a sensitive marker of myocardial necrosis. Therefore, application of the WHO definition in clinical practice results in several patients erroneously diagnosed.

For purposes of risk stratification and subsequent treatment, a sensitive detection of cardiac injury is needed. Assays are available for much more sensitive detection of (minimal) myocardial damage, including assays of cardiac troponins T and I, which are highly specific assays of cardiac troponins T and I, which are highly specific (*Wu et al., 1999*). These developments formed the basis of revised definition of myocardial infarction as recently proposed by the European society of cardiology (ESC) and the American college of

cardiology (ACC) in 2000.

ESC/ACC definition of myocardial infarction:

Any of following criteria satisfies diagnosis of an acute, evolving or recent myocardial infarction:

1. Typical rise and gradual full (troponin) or more rapid rise and fall (creatin kinase MB) of biochemical markers of myocardial necrosis with at least one of the following:
 - A. Ischemic symptoms.
 - B. Development of pathological Q waves on ECG.
 - C. ECG changes indicative of myocardial ischemia (ST segment elevation or depression).
 - D. Coronary artery intervention (e.g. coronary angioplasty).
2. Pathological findings of acute myocardial infarction.

This definition fits with patient's clinical course.

Acute coronary syndrome (ACS) among young adults is relatively low when compared with older population.(Anderson R E et al,2008)

The prevalence of young patients of less than 40 to 45 years of age among ACS patients is variable depending on the

population studied and generally ranges from less than 2 to 10 %.(Marillas p,2007)

It has been observed that there is a high prevalence of current smoking, hyperlipidemia, obesity and family history of coronary artery disease among young ACS patients and the clinical outcome in these group of ACS patients is better than older population.(Chua S K et al, 2010)

Classification of acute coronary syndrome:

Acute coronary syndromes result from acute obstruction of a coronary artery. Consequences depend on degree and location of obstruction and range from unstable angina to non-ST-segment elevation MI (NSTEMI), ST-segment elevation MI (STEMI), and sudden cardiac death.

Classification is based on ECG changes and presence or absence of cardiac markers in blood. Distinguishing NSTEMI and STEMI is useful because prognosis and treatment are different. (*James Wayne W, 2007*).

Unstable angina :

(Acute coronary insufficiency, pre-infarction angina) is defined as:

- Rest angina that is prolonged (usually > 20 min).
- New-onset angina of at least class III severity in the Canadian Cardiovascular Society (CCS).
