Acknowledgment

I am deeply thankful to **Allah**, by grace of whom, the progress and success of this work was possible.

I should express my deep appreciation and great thanks to **Dr. Ihab Khairy Emam**, Professor of Pediatrics, Faculty of Medicine, Ain Shams University for his meticulous supervision, loyal encouragement & valuable advice throughout the work.

Also, I would like to express my deepest appreciation to **Dr. Rania Hamed Shatla**, Lecture of Pediatrics, Faculty of Medicine, Ain Shams University for her great efforts, helpful suggestions, standing beside me and helping me at any time.

Also, I would like to thank children with obesity and their parents for being cooperative.

Last but not the least, I am deeply thankful and always indebted to my parents especially my mother and my sisters who were always supporting and encouraging me. Words fail me to express my appreciation them.

بِسْمِ اللَّهِ الرَّحْمَنِ الرَّحِيمِ

﴿قَالُوا سُبْحَانَكَ لَا عِلْمَ لَنَا إِلَّا مَا عَلَّمْتَنَا
إِنَّكَ أَنْتَ الْعَلِيمُ الْحَكِيمُ﴾

Abstract

Background: Pediatric obesity increases the risk of psychological ill health. Low self-esteem and behavioral problems are probably the most commonly experienced co-morbidities for obese children and adolescents.

Objective: To determine the correlation between food habits and obesity as well as the effects of obesity on self image and self esteem.

Methods: In present cross-sectional study we evaluated 50 children and adolescent with obesity and 30 healthy controls. Their ages ranged from 6-19 years. Studied children were subjected to: anthropometric measurements, Lipid profiles assessment, food habits questionnaire, self esteem and self image questionnaires.

Results: BMI has significant –ve correlation with self image questionnaire and non significant +ve correlation with self esteem questionnaire. Also there was highly significant increase in serum CHOL, TG and a significant decrease in HDL in obese.

Conclusion: Obese children are at increased risk of many psychological morbidities so efficient clinical prevention and intervention programs are essentially needed in obese children.

Introduction and Aim of the Work

Introduction

Obesity is caused by two simple factors, an unhealthy diet (typically too rich in sugar and fats and not enough fibers and carbohydrate) and not doing enough exercise to burn off the calories consumed (**Kerek, 2009**). Other factors can also cause obesity as genetics, nutrition, physical activity and family factors (**Marcus et al., 2002**).

Food habits have strong relation to obesity. Increased meal frequency and daily breakfast consumption have been inversely associated with childhood obesity (**Antonogeorgos et al., 2011**). The dietary habits of children have shifted away from healthy foods (such as fruits, vegetables, and whole grains) to a much greater reliance on fast food, processed snack foods, and sugary drinks. These foods tend to be high in fat and/or calories and low in many other nutrients (**Reilly, 2004**).

The numerous psychosocial, physical and economic consequences of overweight and obesity are well-known. Childhood overweight affects self-esteem and has negative consequences on cognitive and social development (**Hesketh et al., 2004**). Obesity impacts the self-perception of children entering adolescence, especially in girls, but in selected areas of competence. Obese children are at particular risk of low perceived

competence in sports, physical appearance, and peer engagement. Not all obese children are affected, although the reasons for their resilience are unclear (**Franklin et al., 2006**).

Aim of the Work

To determine the correlation between food habits and obesity as well as the effects of obesity on self esteem and self image of children.
