

Effect of Magnesium Sulfate on Doppler Parameters of Fetal Umbilical and Middle Cerebral Arteries in Women with Severe Preeclampsia

Thesis submitted for partial fulfillment
of MD Degree in Obstetrics and Gynecology

By

Ahmed Mohamed Salah El din Abd El Magied Ayoub

M.B, B.Ch. Faculty of Medicine 2008
M.Sc. Obstetrics and Gynecology 2014
AinShams University

Under Supervision of

Prof. Sherif Mohamed Abd El Hamed

Professor of Obstetrics and Gynecology
AinShams University

Prof. Mohamed Ahmed El kady

Professor of Obstetrics and Gynecology
AinShams University

Ass. Prof. Amr Mohamed El helaly

Assistant Professor of Obstetrics and Gynecology
Ain Shams University

Faculty of Medicine
Ain Shams University
2017

بِسْمِ اللَّهِ الرَّحْمَنِ الرَّحِيمِ

Acknowledgments

*First and forever, thanks to **Allah**, Almi ghty for giving me the strength and faith to complete my thesis and for everything else.*

*I would like to express my sincere gratitude to **Prof. Sherif Mohamed Abd El Hamed**, Professor of Obstetrics and Gynecology, Faculty of Medicine – Ain Shams University, under his supervision, I had the honor to complete this work, I am deeply grateful to him for his professional advice, guidance and support.*

*My deep gratitude goes to **Prof. Mohamed Ahmed El kady**, Professor of Obstetrics and Gynecology, Faculty of Medicine – Ain Shams University, for his invaluable efforts and tireless guidance and meticulous supervision throughout this work,*

*I wish also to express my gratitude to **Prof. Amr Mohamed El helaly**, Assistant Professor of Obstetrics and Gynecology, Faculty of Medicine – Ain Shams University, for his great effort, kind advice, support and encouragement throughout the whole work,*

Last but not least, I like to thank my beloved parents and brothers for their persistent assistance, kind care, help and encouragement.

Ahmed Ayoub

ABSTRACT

Background: Magnesium sulfate (MgSO_4) is used in women with severe preeclamptic toxemia for neuroprotection from seizures and can help to prevent serious complications

Objective: To assess the effect of MgSO_4 before and after its administration on Doppler ultrasound parameters of fetal umbilical artery (UA) and middle cerebral arteries (MCA) in pregnant women with severe pre-eclampsia.

Patients and Methods: A total of 52 patients with severe preeclampsia admitted to Ain Shams University Maternity Hospital were evaluated. Before and after administration of magnesium sulfate, Doppler ultrasound scan was carried out to measure umbilical artery and fetal middle cerebral artery blood flow. Paired t-test was used for statistical analysis.

Results: After injection of magnesium sulfate, the mean resistivity index (RI)-umbilical, and pulsatility index (PI)-cerebral showed a statistically significant reduction ($P < 0.001$). The cerebroumbilical C/U ratio increased after the intervention ($P < 0.001$). The PI-umbilical ($P = 0.1$) and pre- and post-RI-cerebral ($P = 0.96$) did not have statistically significant changes.

Conclusions: Infusion of magnesium sulfate significantly decreases the flow in the fetus RI-umbilical and PI-MCA, and it increases C/U ratio indices in color Doppler ultrasound.

Key words: Doppler ultrasound, eclampsia, magnesium sulfate, preeclampsia

Introduction

Pre-eclampsia is defined as new hypertension presenting after 20 weeks with significant proteinuria which in turn is defined as urinary protein:creatinine ratio is greater than 30 mg/mmol or a validated 24-hour urine collection result shows greater than 300 mg protein (**NICE clinical guidelines, 2010**)

Pre-eclampsia and eclampsia are among the common causes of death and disability in pregnant women and are associated with increased vascular resistance and decreased uteroplacental perfusion. It is characterized by vascular contraction, lesions in the placenta and umbilical arteries, high blood pressure, proteinuria, and seizure (**Roberts et al., 2003**).

This disease can cause many fetal and maternal complications. Maternal complications include acute renal failure, liver damage, intracerebral hemorrhage, pulmonary edema, and death. Fetal complications are preterm birth or intrauterine growth restriction or intrauterine fetal death (**Roberts et al., 2002/ Sibai et al., 2002**).

Magnesium sulfate (MgSO_4) is used in women with severe preeclamptic toxemia for neuroprotection from seizures and can

help to prevent serious complications (**Euser et al., 2009/ Witlin et al., 1998**).

The exact mechanism by which magnesium sulphate exerts a protective role in the prevention of neuronal injury in the fetal brain has not been elucidated. However there is evidence for various effects of magnesium sulphate, some or all of which likely play a role in the neuroprotective effect observed (**Marret et al., 2007**), through one or more of the following mechanisms : Reduction of inflammatory cytokines or free radicles produced during hypoxic-ischemic reperfusion, prevention of excitotoxic calcium-induced injury, membrane stabilization by preventing the membrane depolarization, inhibition of the glutamate receptors involved in injury to preoligodendrocytes, stabilization of fluctuations in blood pressure that occur in neonates, and an increase in cerebral blood flow (**Conde-Agudelo et al., 2009/ Constantine et al., 2011/ Heybone et al., 2010/ Mercer et al., 2009**). Other animal data suggest that MgSO_4 may serve an antiapoptotic role and prevent neuronal cell loss (**Burd et al., 2010**).

During asphyxia, there is excessive release and reduced uptake of glutamate in the brain. Glutamate acts on the N-methyl-D-aspartate (NMDA) receptor, a postsynaptic ion channel,

allowing excessive calcium influx into the neurons and inducing neuronal injury (**Bhat et al ., 2009**).Fetal and newborn brains seem to be more susceptible to damage from glutamate release (**Doyle et al., 2009**). MgSO_4 is a naturally occurring NMDA receptor antagonist that blocks neuronal influx of calcium within the ion channels, preventing posthypoxic brain injury (**Bhat et al., 2009**)

Beneficial haemodynamic effects of magnesium sulphate have also been postulated, with potential increased cerebral perfusion and a stabilizing effect on neonatal blood pressure variability reported(**Macdonald et al., 2004/ Rantone et al., 2002**).

The large well designed randomized controlled trial (BEAM trial) which assess the neuroprotective benefit of MgSO_4 , provide strong evidence that in utero fetal exposure to MgSO_4 in mothers at risk for premature delivery reduces the risks of developing cerebral palsy without affecting the rate of perinatal or infant death. Selecting the right patient candidate and identifying the ideal dosing regimen are still unclear and requires further research (**Rouse et al., 2008**).

The French PREMAGmulticenter randomised trial that included women with no pregnancy associated vascular disease

and at risk of preterm delivery before 33 weeks of gestational age. Its goal was to assess the effectiveness of a single MgSO₄ infusion in preventing mortality and/or WMI (white matter injury) in newborn (Marret et al., 2006).

In pregnancy, usually umbilical artery is tested by Doppler ultrasound but some recent studies also test maternal and fetal middle cerebral arteries (MCA) (Bahlmann et al., 2002/ Ebrashy et al., 2005). In one study, the reference value of resistive index (RI) and pulsatility index (PI) have been investigated in Iranian patients (NICE clinical guidelines)*. The ratio of middle cerebral artery/umbilical artery (C/U ratio) can be a good indicator of fetal prognosis and fetal well-being (Tarzamni et al., 2009/ Kassanos et al., 2003).

Doppler ultrasound is a useful tool for studying pathophysiological mechanisms that can affect the fetal hemodynamic status (Rana et al., 2005/ Mihu et al., 2011/ Baschat et al., 2003). Assessing the changes in the arteries with Doppler ultrasound can show the adaptation of fetus to the situation (Ebrashy et al., 2005/ Divon et al., 1996).

An increase in umbilical artery resistance shows as a decrease in perfusion. If the situation continues, RI in the middle cerebral artery will decrease (Mihu et al., 2011).
