

The Role of Multidetector CT In The Assessment of The Left Ventricular Function

Essay

Submitted for Partial fulfillment of the Master Degree in Radiodiagnosis

Presented by

Mary Rabea Mahrous

M.B.B.Ch.

Resident of Radiodiagnosis at National heart institute

Supervisors

Prof.Dr. Laila Hosny Mahmoud

Professor of Radiodiagnosis

Faculty of Medicine

Ain Shams University

Dr. Amir Louis Luka

Lecturer of Radiodiagnosis

Faculty of Medicine

Ain Shams University

2011

دور الأشعة المقطعية متعددة المقاطع في تقييم وظائف البطين الأيسر للقلب

بحث

مقدم توطئة للحصول علي درجة الماجستير في الأشعة التشخيصية

مقدم من

ماري ربيع محروس

بكالوريوس الطب وا جراحة

طبيب مقيم الاشعة التشخيصية بمعهد القلب القومي

المشرفون

الأستاذ الدكتور / ليلي حسني محمود

أستاذ الأشعة التشخيصية

كلية الطب

جامعة عين شمس

2011

*First and foremost, I feel always indebted to **Allah**, the most kind and the most merciful.*

*I would also like to express my great thanks and gratitude to **Prof. Dr. Laila Hosny Mahmoud** Professor of Radiodiagnosis, Faculty of Medicine, Ain Shams University, for giving me the honour of being her candidate, working under her supervision, guided by her scientific experience, precious advices and valuable remarks.*

*I would like to express my deepest thanks and gratitude to **Dr. Amir Lewis louka**, Lecturer of Radiodiagnosis, Faculty of Medicine, Ain Shams University, for his generous help and continuous encouragement for achieving this work,*

I would also like to express my love, respect, appreciation and thanks to my family for their kind care and love which without them I could not properly finish this work,

Mary Rabea Mahrous

Arabic summary	--

List of Abbreviations

Abbreviation	Stands for
AHA	American heart association
AM	Acute marginal branch
ASC Ao	Ascending aorta
AV	Atrio-ventricular
bpm	Beats per minute
BSA	Body surface area
CAD	Coronary artery disease
CB	Conus branch
CCT	Cardiac computed tomography
CMPs	Cardiomyopathies
CMRI	Cardiac magnetic resonance imaging
CO	Cardiac output
CS	Coronary sinus
CT	Computerized tomography
CTA	Computerized tomography angiography
ECG	Electrocardiogram
EDV	End diastolic volume
EF	Ejection Fraction
ESV	End-systolic volume
HCM	Hypertrophic Cardiomyopathy.
HM	Hibernating myocardium
HR	Heart rate
HU	Hounsfield unit
IMB	Intermediate branch
IVC	Inferior vena cava
LA	Left atrium
LAA	Left atrial appendage
LAD	Left anterior descending
LCx	Left circumflex
LV	Left ventricle
LVEF	Left ventricular ejection fraction

List of Abbreviations (Cont.)

LVMM	Left ventricular myocardial mass
LVV	Left ventricular volume
MDCT	Multidetector Computerized tomography
MI	Myocardial infarction.
MIP	Maximum-intensity projection
MRI	Magnetic resonant imaging
MV	Mitral valve
PA	Pulmonary artery
PDA	posterior descending artery
PV	Pulmonary vein
RA	Right atrium
RAA	Right atrial appendage
RCA	Right coronary artery
RV	Right ventricle
SN	Sinus node
SPECT	Single photon emission computed tomography
SV	Stroke volume
SVC	Superior vena cava
TTE	Trans thoracic echocardiography

List of Tables

Table	<i>Title</i>	<i>Page</i>
1	Coronary Artery Segments.	28
2	Comparison of prospective ECG-gating and retrospective ECG-gating for diagnosis of coronary artery disease (with 64- or more detector row scanners).	64
3	Cardiac CTA acquisition parameters recommended by constructors for currently available scanners.	80
4	Clinically relevant cardiac function parameters.	102
5	Reference values of global left ventricular function for all ages.	103

List of Figures

Fig.	Title	Page
1	3D volume rendering, The cardiac silhouette	4
2	Volume-rendered image: superior anterior view of left and right coronary arteries	5
3	Anatomy of the superior vena cava	6
4	LAO sagittal reconstruction shows RA and RAA.	8
5	Axial (left) and coronal (right) reconstructions showing the crista terminalis.	8
6	(a) Electronic cast traces the inflow and outflow tracts through the right ventricle. (b) Short-axis view showing crescent shaped right ventricle curving around the left ventricle	9
7	Axial (left) and sagittal oblique (right) reconstructions showing the right ventricle and the moderator band.	10
8	(a) Short-axis view and (b) anatomic specimen showing the moderator band	10
9	Electronic cast from anterior (a) and cranial (b) showing the relationship between the pulmonary trunk and its branches to the aorta	11
10	3 D electronic cast of pulmonary trunk and its branches.	12
11	Axial reconstructions showing the pulmonary veins.	13
12	3D view showing left atrium, left auricle, left superior pulmonary veins, left inferior PV, right superior PV, right inferior PV	14
13	3D electronic cast showing the superior–posterior position of left atrium	15

List of Figures (Cont.)

Fig.	Title	Page
14	Two-chamber-view slice, and (b) anatomic specimen. of left ventricle; left atrium and left atrial appendage.	15
15	(a) Oblique slice showing a two-chamber view in systole. (b) The corresponding anatomic specimen.	16
16	Axial and 3D-reconstructions illustrating the shape and location of the left atrial appendage	16
17	Short-axis cross-sectional slices and a specimen showing a roughly circular left ventricle with irregular endocardial surface.	17
18	Long-axis slices showing the differences in wall thickness between anterior and inferior walls and the thin apex.	18
19	Right anterior oblique (RAO) reconstruction through the posterior aspect of the left ventricle (LV).	18

Fig.	Title	Page
78	Typical contrast-enhanced myocardial MDCT images showing axial slices (a) at baseline (pre-infarct) 5 min after contrast, (b) post infarct during first-pass contrast injection, and (c) post infarct 5 min after contrast injection. The infarcted region is represented by the sub-endocardial anterior hyperintense region (arrows).	109
79	Measurement of global functions (A) short axis view in end diastole, (B) short axis view in end systole, (C) Blood volume-versus-cardiac phase	110
80	Four-chamber view of case of cor pulmonale.	111
81	Blood volume-versus-cardiac phase plot (A) in cor pulmonale patient (B) in normal person.	111
82	Horizontal long-axis image during end-systole.	112
83	Three-dimensional caliber measurements of the myocardial walls in a vertical long axis image.	112
84	Axial CT image (A) shows asymmetric hypertrophy of the inter-ventricular septum.	113
85	Diastolic coronal view shows LV apical aneurysm in patient with HCM.	113
86	Calcified aneurysm of the apical and inferior segments of LV.	114
87	Old MI showing low attenuation value.	114
88	Short axis images of anteroseptal akinesia with extensive myocardial infarction in territory of left anterior descending artery.	115
89	Midventricular short-axis and 2-chamber views obtained during end-systole (C and D) and end-diastole (E and F).	116

Introduction

Accurate detection of left ventricular volumes and ejection fraction is fundamental for the diagnosis, prognosis and follow-up of many different forms of cardiovascular disease. **(Vural et al., 2010).**

Evaluation of the left ventricular structure and function is an integral step in determining prognosis and therapy for heart failure patients. **(Mangalat et al., 2010).**

Echocardiography is the most widely used imaging technique for this purpose. It is an easily available bedside method that is also cheap, fast and noninvasive. Despite these advantages, echocardiography has some handicaps such as a poor acoustic window and operator dependency. The image quality can be unfavorably affected in obese patients and patients with chronic obstructive lung disease, and quality echocardiographic views cannot be obtained in up to 10% of the patients. Although sonographic contrast agents can be administrated to obtain better image quality, they are not widely used. **(Vural et al., 2010).**

Radionuclide ventriculography and cine ventriculography have also been used for assessment of LV ejection fraction (EF) in selected patients, but are limited by poor spatial resolution and geometric assumptions. **(Curtin et al., 2007).**

Currently, magnetic resonance imaging (MRI) is the gold standard technique for assessing left ventricular volumes and ejection fraction. **(Salm et al., 2006).**

However, due to the duration and multiple prolonged breath-holds required to obtain adequate images, inability to perform the study in patients with devices and claustrophobia in some patients, MRI is not always feasible. **(Mangalat et al., 2010).**

With increased utilization of devices in heart failure such as implantable cardioverter defibrillators (ICDs) and pacemakers and
