Acknowledgment

First and foremost, I thank Allah, The most merciful, for his helping and guiding me throughout this work,

*I would like to express my sincere gratitude to **Professor Dr. Manal El Sayed Abd EL Meguid**, Professor of Pediatrics, Faculty of Medicine, Cairo University for her great support, eminent guidance and precious advice throughout this work,*

*A special tribute to **Professor Dr. Lobna Sayed Sherif**, Professor of Child Health, National Research Center, for her great effort, continuous support , active persistence guidance, faithful advices and overwhelming kindness throughout this work,*

*My sincere thanks are due to **Professor Dr. Ihsan Aly Badawy**, Professor of Medical Biochemistry, National Research Center for her great effort throughout this work,*

*My utmost thanks and appreciation to **Dr. Reem Nabil Said**, Assistant Professor of Pediatrics, Faculty of Medicine, Cairo University for the continuous encouragement, great effort and valuable time she had offered me during the work,*

*I would like to extend my deep gratitude to **Dr. Manal Mansour Abdel Rahman**, Assistant Professor of Child Health, National Research Center for her great effort and valuable advice throughout this work,*

*My deep gratitude is awarded to **Professor Dr. Mahmoud Abdel Aziz**, Professor of Molecular Biology, National Research Center and his skillful team for giving me the chance to work under his supervision with his creative mind.*

*A special appreciation to **Professor Dr. Amany El Wakkad**, Professor of medical Biochemistry, National Research Center for her expert participation ,valuable time and great effort throughout this work,*

*To my Family and my Husband who
suffered a lot during this work,*

*To my Senior Staff and Colleagues in
the Child Health Department,
National Research Center,*

and

To all my Patients,

Thank you

Abstract

Respiratory distress syndrome and its sequel Broncopulmonary dysplasia remain an important cause of morbidity and mortality in neonates, in spite the great progress and advanced management modalities.

In our study, the levels of L-arginine and endothelin-1 were measured in the serum of preterm neonates with respiratory distress syndrome in the 1st day of life and were compared with preterm neonates without RDS as a control group.

Serum L-arginine in the 1st day of life was significantly lower in the neonates with RDS than the control group. Serum endothelin-1 was significantly higher in the neonates with RDS compared with the control group.

Both L-arginine and endothelin-1 levels showed no statistical difference as regard gender, mode of delivery nor the administration of antenatal steroids.

A significant negative correlation was found between L-arginine and birth weight in the neonates with RDS while a non significant positive correlation was reported between L-arginine and the severity of the disease measured by oxygenation index.

On the other hand, Endothelin-1 has a non significant positive correlation with both gestational age and Oxygenation Index and a significant positive correlation with the birth weight.

Endothelin-1 was found to be significantly higher in the BPD group than the survivor group in the studied cases from day one of life.

In conclusion; further studies are recommended to use L-arginine as a supplementation therapy for RDS patients instead of using Inhaled Nitric Oxide therapy with its limitation.

Moreover, serum endothelin-1 level can be used as an early indicator for BPD.

Key words: L-arginine, Endothelin-1, Preterm, Oxygenation index.

List of Abbreviations

ABG	Arterial blood gases
AOE	Antioxidant enzyme
ARDS	Adult respiratory distress syndrome
BPD	Bronchopulmonary dysplasia
cGMP	Cyclic guanine monophosphate
CBC	Complete blood count
CLD	Chronic lung disease
CMV	Control mode ventilation
CPAP	Continuous positive air way pressure
ED	Endothelium dysfunction
EDRF	Endothelium relaxing factor
ET-1	Endotheline-1
GA	Gestational age
Hb	Hemoglobin
HFV	High frequency ventilation
HMD	Hyaline membrane disease
HR	Heart rate
INO	Inhaled nitric oxide
IL	Interleukin
IUGR	Intra uterine growth retardation
IVH	Intraventricular haemorrhage
L/S	Lecithin/sphingomyelin

LBC	Lamellar body count
LT	leukotrienes
MAP	Mean airway pressure
MAS	Meconium aspiration syndrome
MRNA	Messenger ribonucleic acid
NEC	Necrotizing enterocolitis
NICU	Neonatal intensive care unit
NO	Nitric oxide
NOS	Nitric oxide synthetase
O ₂	Oxygen
OI	Oxygenation index
PC	Phosphatidylcholine
PCo ₂	Arterial partial pressure of carbon dioxide
PCR	polymerase chain reaction
PDA	patent ductus arteriosus
PECAM	Platelets endothelium adhesion Molecule
PG	Phosphatidylglycerol
PI	Phosphatidylinositol
PIE	pulmonary interstitial emphysema
PLTs	Platelets
PMA	Post menstrual age
Po ₂	Arterial partial pressure of oxygen
PPHTN	Persistent pulmonary hypertension of the Newborn
PPV	Positive pressure ventilation
PT	Preterm
PVH	Per ventricular haemorrhage
RBCs	Red blood cells
RDS	Respiratory distress syndrome
SNIPP	Synchronized nasal intermittent positive pressure ventilation
SOD	Super oxide dismutase
TA	Tracheal aspirate
TGF α	Transforming growth factor α
TLC	Thin layer chromatography

TPN	Total parental nutrition
TTN	Transient tachypnea of newborn
TV	Tidal volume
VLBW	Very low birth Weight
VR	Vascular resistance
WBCs	White blood cells
WT	weight

Introduction

Preterm birth is the largest single cause of perinatal morbidity and mortality in infants without major anomalies. Complications of prematurity account for greater than 70% of fetal and neonatal deaths annually and more than one third of health care expenditures during the first year of life (*Martin et al., 2003*).

Respiratory distress syndrome (RDS) and its sequel broncopulmonary dysplasia continue to be major contributor of morbidity and mortality in preterm infants, as it is the most common cause of respiratory failure in neonates (*Jobe and Bancalari, 2001*).

Progress in neonatal intensive care unit (NICU) is closely related to improvement in the management of respiratory failure in preterm infants (*Ammari et al., 2006*).

L-arginine is the substrate for the synthesis of Nitric oxide (NO), a potent vasodilator in systemic, gastrointestinal and pulmonary circulation (*Meng-Cheng et al., 2006*).

Colagrande et al., (2006) have proved that NO plays a critical role in the regulation of normal blood pressure,

vascular resistance, preservation of endothelial function and protection against ischemic reperfusion damage.

Canpolat et al., (2005) have demonstrated an early decrease in blood L- arginine level in neonates with RDS. Moreover, this study showed that the level of L-arginine is inversely related to the severity of RDS, as measured by oxygenation index.

Niu et al., (2005) reported that ET-1 can be used as a marker for pulmonary endothelial injury. They documented an increase of plasma ET-1 concentrations in infants with RDS. Moreover, a significant increase in ET-1 concentration in the tracheal aspiration of infants who developed late broncopulmonary dysplasia was documented from day one of life.

Aim of Work

The present study was conducted to:

- Investigate the relationship between the level of serum L-arginine in preterm neonates and the severity of respiratory distress syndrome as measured by oxygenation index.
- Investigate the relationship between serum L-arginine level and the outcome of RDS in preterm neonates.
- Investigate the relationship between the level of serum Endothelin-1 in preterm neonates and the severity of respiratory distress syndrome as measured by oxygenation index.
- Verify the use of serum Endothelin-1 as a marker for early prediction of BPD.
