بِسْمِ اللَّهِ الرَّحْمَنِ الرَّحِيمِ

قَالُوا سُبْحَانَكَ

لَا عِلْمَ لَنَا إِلَّا مَا عَلَّمْتَنَا

إِنَّكَ أَنْتَ الْعَلِيمُ الْحَكِيمُ

(سورة البقرة الآية ٣٢)

صَدَقَ اللَّهُ الْعَظِيمُ

ACKNOWLEDGEMENT

I wish to express my sincere gratitude and great thanks to Dr. M.Y. El-Kady , professor of Organic Chemistry, Faculty of science ,Ain Shams University , for his great support, endless patience, valuable advice, and kind care of this work.

I am also sending my great appreciation for Dr. R.A. El-Adly , Professor of petroleum Chemistry, Egyptian Petroleum Research Institute for his suggesting the research point, guidance, support, deep revision and valuable guidance of this work.

I wish also to introduce great thanks for Dr. M.M.H. Khalil, professor of Analytical Chemistry, Faculty of science ,Ain Shams University , for his great support, deep revision, valuable advice, and kind care of this work.

I would like to thank Dr. Modather Farouk Faculty of science, Al-Azher university for his help and cooperation throughout the experimental study of the present thesis and all the lab team who support me by devices, and chemicals needed to carry out this work.

I would like to express my gratitude and appreciation to my family for their patience, encouragement, and motivation for me to move forward.

ABSTRACT

Pruning of the very large quantities of rice straw (RS) which amount to about 3.28 million ton per year causes a series environmental problems. The utilization of rice straw as thickening and filling agents in the production of lubricating grease constitutes, therefore, one of the major outlets in this respect. On the other hand, this could be considered as a novel application in the area of lubricants manufacture. In the present investigation, the physicochemical characteristics of rice straw were determined. This was followed by treating rice straw with sodium hydroxide solutions of different concentrations for a different periods ranging from 2 to 6 hours at various temperatures of 80 °C up to 120 °C. Furthermore, vegetable oils have significant potential as a base fluid . In this respect, waste cooking oil was used as a substitute of the fresh vegetable oil. The physicochemical properties of the waste cooking oil were also investigated. Accordingly, the optimum yield from treated rice straw (TRS) and waste cooking oil (WCO) were both utilized in the preparation of such lubricating grease. The physicochemical properties of one or more were evaluated according to National Lubricating Grease Institute (NLGI) and Egyptian Standard (ES). It was found that the obtained greases have promising results from the economical and environmental aspect.
