

# **Updates on Enteral versus Parenteral Nutrition in Pancreatitis**

## ***Essay***

**Submitted for partial fulfillment of Master Degree  
*In General Intensive Care***

**By**

**Amr Mohammed Sharaf El-Din**

M.B., B.Ch, (Cairo University, 2012)

**Under Supervision Of**

**Prof. Dr. Mohammed Ismail ELseady**

*Professor of Anesthesia, Intensive Care and Pain Management  
Faculty of Medicine –Ain Shams University*

**Dr. AmalHamedRabie**

*Lecturer of Anesthesia, Intensive Care and Pain Management  
Faculty of Medicine –Ain Shams University*

**Dr. YahiaMamdouh Hassan Mekki**

*Lecturer of Anesthesia, Intensive Care and Pain Management  
Faculty of Medicine –Ain Shams University*

Faculty of Medicine  
Ain Shams University

**2017**

بِسْمِ اللَّهِ الرَّحْمَنِ الرَّحِيمِ

# قَالَ

سَبَّحَانَكَ لَا إِلَهَ إِلَّا مَا عَلَّمْتَنَا إِنَّكَ أَنْتَ  
الْعَلِيمُ الْعَظِيمُ

صدق الله العظيم

سورة البقرة الآية: ٣٢

## Acknowledgments

First and forever, thanks to **Allah**, Almighty for giving me the strength and faith to complete my thesis and for everything else.

I would like to express my sincere gratitude to **Prof. Dr. Mohammed Ismail ELseady**, Professor of Anesthesia, Intensive Care and Pain Management, Faculty of Medicine –Ain Shams University, under his supervision, I had the honor to complete this work, I am deeply grateful to him for his professional advice, guidance and support.

My deep gratitude goes to **Dr. AmalHamedRabie**, Lecturer of Anesthesia, Intensive Care and Pain Management, Faculty of Medicine –Ain Shams University, for her valuable efforts and tireless guidance and meticulous supervision throughout this work.

I can't forget to thank with all appreciation **Dr. YahiaMamdouh Hassan Mekki**, Lecturer of Anesthesia, Intensive Care and Pain Management, Faculty of Medicine –Ain Shams University, for the efforts and time he had devoted to accomplish this work.

Last but not least, I like to thank all my **Family**, especially my **Parents**, for their kind care, help and encouragement.

 **Amr Mohammed Sharaf El-Din**

# Introduction

**A**cute pancreatitis is one of the most common diseases of the digestive system leading to large physical and economic burdens (*Peery et al., 2012*). In the majority of patients, acute pancreatitis runs a mild clinical course. However, in patients who develop necrotizing pancreatitis, mortality rate increases (*van Santvoort et al., 2011*).

Pancreatitis is a potentially fatal disease that requires nutritional support which is considered a primary issue in the therapy of the disease (*Chang et al., 2013*).

Optimal nutritional support in acute pancreatitis has been a subject of debate for decades. Initially, the concept of pancreatic rest by fasting was thought to improve outcome because enteral nutrition was believed to aggravate inflammation through pancreatic stimulation. Subsequently, parenteral nutritional support was believed to avoid pancreatic stimulation and provide the needed nutritional components. (*Lodewijkx, et al., 2016*)

Recently, many trials on enteral nutrition were performed showing a benefit of enteral nutrition, which became superior to parenteral nutrition, although several limitations should be taken into account (*Tenner, et al., 2013*).

The optimal route of enteral nutrition remains unclear, but normal or nasogastric tube feeding seems safe when tolerated. When nasogastric nutrition is not tolerated, or when the caloric need is not reached, nasojejunal feeding tube located beyond Treitz' ligament is recommended(*Gerritsen,et al.,2015*).

The clinical course of acute pancreatitis varies from a mild transitory form to a severe necrotising disease. Most episodes of acute pancreatitis (80%) are mild and self limiting, subsiding spontaneously within 3–5 days. Patients with mild pancreatitis respond well to medical treatment, requiring little more than intravenous fluid resuscitation and analgesia. In contrast, severe pancreatitis is defined as pancreatitis associated with organ failure and/or local complications such as necrosis, abscess formation, or pseudocysts(*Yokoe, et al., 2015*).

The management of acute pancreatitis has been controversial over the past decades, varying between a conservative medical approach on the one hand and an aggressive surgical approach on the other. There has been great improvement in knowledge of the natural course and pathophysiology of acute pancreatitis over the past decade (*Carter, et al., 2017*).

## **Aim of the Essay**

**T**he aim of the essay is to highlight the role of enteral nutrition in comparison with parenteral nutrition in pancreatitis.

## Chapter (1): Diagnosis of Pancreatitis

**A**cute pancreatitis (AP) is one of the most common diseases of the gastrointestinal tract, leading to tremendous emotional, physical, and financial human burden. An increase in the annual incidence for AP has been observed in most recent studies (*Peery et al., 2012*).

**Figure (1):**Position and structure of pancreas(*Paulet et al.,2015*)

- **Function of the pancreas**

Classically, the pancreas has two roles, an "endocrine" role, relating to the secretion of insulin and other substances within pancreatic islets helping control blood sugar levels and metabolism within the body, and an "exocrine" role,

relating to the secretion of enzymes involved in digesting substances from outside of the body(*Paulet al.,2015*).

Sugar control and metabolism are controlled by Approximately 3 million cell clusters called pancreatic islets which are present in the pancreas, within these islets are four types of cells which are involved in the regulation of blood glucose levels. Each type of cell secretes a different type of hormone:(1)  $\alpha$  alpha cells secrete glucagon (increase glucose in blood),(2)  $\beta$  beta cells secrete insulin (decrease glucose in blood),(3)  $\delta$  delta cells secrete somatostatin (regulates/stops  $\alpha$  and  $\beta$  cells) and (4) PP cells, or  $\gamma$  (gamma) cells, secrete pancreatic polypeptide (affect satiety). These act to control blood glucose through secreting glucagon to increase the levels of glucose, and insulin to decrease it(*Paul et al.,2015*).

Also the pancreas plays a vital role in the digestive system. It secretes the pancreatic fluid that contains digestive enzymes into the duodenum. These enzymes help to break down carbohydrates (usually starch), proteins and lipids. Cells are arranged in clusters called acini. Secretions into the middle of the acinus accumulate in intralobular ducts that drain to the main pancreatic duct, which drains directly into the duodenum. The cells are filled with granules containing the digestive enzymes. These are secreted in an inactive form called (zymogens or proenzymes). When released into the

duodenum, they are activated by the enzyme enteropeptidase present in the lining of the duodenum. The proenzymes are cleaved, creating a cascade of activating enzymes: enteropeptidase activates the proenzymetrypsinogen by cleaving it to form trypsin. The free trypsin then cleaves the rest of the trypsinogen, as well as chymotrypsinogen to its active form chymotrypsin (*Hall&John2011*).

The pancreatic enzymes include Proteases, for the digestion of proteins, (trypsinogen and chymotrypsinogen). Lipase for the digestion of fats, and Amylase, for the digestion of carbohydrates. The pancreas also secretes phospholipase A2, lysophospholipase, and cholesterol esterase. Secretion of these proenzymes is via the hormones gastrin, cholecystokinin and secretin, which are secreted by cells in the stomach and duodenum in response to distension and/or food (*Hall&John 2011*).

- **Pathophysiology of AP**

Pathophysiology of AP encompasses complex cascaded events of acinar cell inflammation, involvement of immune system, and systemic pathological outcomes (*Shamoon,2016*).

Premature activation of intra-acinar digestive zymogens is one of the early hallmarks of AP. The resultant autodigestion of pancreas leads to release of pro-inflammatory mediators such

as tumor necrosis factor- $\alpha$ , interleukin (IL)-1 $\beta$ , IL-6, which intermingle with microcirculation, causing increased vascular permeability, edema, hemorrhage, and necrosis of pancreas (*Ramnath,et al.,2010*).

Profound acinar cell injury and amplified inflammatory responses give rise to systemic inflammatory response syndrome (SIRS) and multiple organ dysfunction syndrome (MODS), ultimately responsible for AP-associated mortality. The immune system is thought to play an important role in the disease patho-genesis of AP. Complex immunological events underlie progres-sion of AP (*Zheng,2013*).

Dysregulated immune responses during AP include increased leukocyte counts, migration and activation of pro-inflammatory innate immune cells (neutrophils and macrophages) as well as depletion of T-lymphocytes and raised levels of plasma pro-inflammatory cytokines (*Shamoon,2016*).

### ▪ Etiology of acute pancreatitis

Many causes of acute pancreatitis have been discovered. The main causes are gallstone migration and alcohol abuse. Other causes are uncommon, situational, controversial, or have not yet been completely elucidated(*Bruno,2008*).

### 1- Obstruction of the common bile duct by stones (38%)
