Statement

This thesis is submitted as a partial fulfillment of Doctor of Philosophy in Architectural Engineering Engineering, Faculty of Engineering, Ain shams University.

The author carried out the work included in this thesis, and no part of it has been submitted for a degree or a qualification at any other scientific entity.

Abdelbaseer Abdelraheem Mohamed Elsayed

Date: 29 August 2015

Researcher Data

Name	Abdelbaseer Abdelraheem Mohamed Elsayed
Date of birth	14/06/1983
Place of birth	Sharkia
Last academic degree	M.Sc. in Architecture
Field of specialization	Urban Planning
University issued the degree	Ain Shams University
Date of issued degree	2010
Current job	Architect

Thesis Summary

This thesis seeks to prove how socio-economic factors are very dependent on spatial variables. Cairo, a fragmented city where rich and poor people live side by side, is chosen as a case study to test out various interdisciplinary approaches and theories.

Guided by literature on relationships of societal and spatial factors the research develops a 'comprehensive approach' derived from *Space Syntax* theory, to investigate the mutual relations of the spatial layout of built environment and socio-economic aspects at both a city and a settlement levels. Four methodological procedures (space syntax, observation, questionnaire, document analysis) are employed to fill in the items of the developed framework. After reviewing different insights on physical and social issues, a methodology chapter is introduced to elaborate the elected research methods.

The empirical part of this thesis consists of three chapters, first of which investigates the implications of the spatial configuration of the street network on the socio-economic profile in various neighborhoods in Cairo metropolitan area. Second of which extends the findings of the previous chapter through investigating the correlation between spatial factors and the distribution of internal and edge commercial land use. Furthermore, the relationship between spatial parameters and pedestrian movement pattern is examined in this chapter. Third of which incorporates the results of the previous chapters in the interpretation phase, questionnaire. That is to understand issues related to demographic profile, belongingness, places of interaction and safety, as well as revealing the correspondence between physical and social segregation. The cases used here are three informal areas in Cairo: Ezbet Bekhit, Ezbet Al-Nasr and Abu Qatada. The first two areas are located on State owned desert land close to the city center, while the third area is located on private agricultural land illegally built on the fringe

of the city. Informal settlements are chosen because they are self-grown and not influenced by plans or land use regulations.

The findings at a city level showed that social factors are significantly correlated with the spatial structure of the street network on city-wide scales. Zooming in, disadvantaged areas display a strong internal spatial structure, while at the same time lacking external links to the surrounding areas and the whole city. On the other hand, the findings at a settlement level showed that the distribution of commercial activities takes place on plots that are located along the spatially most integrated parts of the neighborhoods in relation to the whole city. Furthermore, syntactic variables were related significantly to pedestrian movement flow. Besides, the results of questionnaires demonstrated that informal settlements have territorial preference, and are generally socially excluded. Seemingly, this complements the results of previous chapters.

Taken all together, urban and social segregation are closely related. Seemingly, spatial segregation makes the framework for aggravating social segregation. Therefore, improving the spatial integration should also stimulate social as well as economic integration.

The current planning practice in Cairo, however, contributes to create the spatial conditions for aggravating the social segregation processes between various social groups. Studying the forces which produce these poor spatial conditions would invariably help reverse the vicious cycle of urban decline apparent in the city. There is also a challenge to implement the use of space syntax analyses in strategic urban planning in Cairo. Nonetheless, improving connectivity is likely to generate new movement patterns that will draw in new economies, stimulate investment and so stimulate the “virtuous cycle” of regeneration.

Keywords: social segregation, spatial segregation, space syntax, informal areas

ACKNOWLEDGEMENT

All praise to Allah, Lord of the world, whom alone I worship, and from him alone do I implore help. I dedicate this work to Allah and to prophet Mohamed (peace be upon him).

I am pleased to have the opportunity to express my gratitude to those precious people who helped me to complete this thesis. Thanks a lot for DAAD and CNRD for funding this PhD work. Without your financial help I would never be able to produce this work within three years. I would like to thank ITT at Cologne University for Applied Sciences for hosting me for two semesters during my stay in Germany. Thank you Carnegie fellowship at American University in Washington DC for funding me during the last stage of my PhD; the period I spent in USA was really wonderful and it helped me a lot to improve my work.

The thanks is due to my supervisor, Dr. Mohammed A. Salheen, for the time he devoted, the insight, and the discussions. What I learned from him goes beyond this thesis. He is the first person who explained to me space syntax theory and method during master period. I am luck that he is my mentor for both master and PhD stages.

My sincere gratitude is to Dr. Marwa A. Khalifa for advice, ideas, feedback and encouragement. I remember that day when she informed me about DAAD and CNRD scholarship and she asked the selection committee to postpone the deadline for applications for two days in order to be able to make a proposal.

The thanks is also to Prof. Johannes Hamhaber for continuous discussion and wonderful ideas for refining my work. Many Thanks is to Prof. Christine Kohlert for accepting to supervise my work. Thanks a lot for her for the time I spent in her company in Munich learning many things from my wonderful friend Christian Schwander.

I would like also to record my thanks to Prof. Diane Singerman, David Stanek, Sara Salman, and Abeer Mashni for continuous support during my stay in Washington DC.

I also would like to thank space syntax community for informal discussion. Many thanks also to Mr. Mohamed Youssef from Urban Upgrading Unit (UUU) for discussion and for data he provided. Thanks also go to Eng. Ahmed Nasr for providing me with a digital GIS map of Cairo. Without that map, I would never be able to construct Cairo axial model. I am grateful also to Mr. Mohamed Khalifa for his advice regarding statistical analysis.

I am extremely grateful to my wonderful close friend Akkelies van Nes for inviting me to spend one month in her home in Delft, Netherlands. Akkie helped me a lot through teaching me many important things about urban planning and through giving access to me through her private library. Also, she introduced me to her colleagues and students at TU-Delft. Then we worked and published together in many international conferences. Akkie paid for my stay in the hotel and even for food and everything. She is always generous and kind and that is Akkie whom I like so much. I remember wonderful days in Karaoke bar, Ingrid and Snorre and everything I memorize perfectly. I would like also to thank Akkie for accepting to be an external foreign examiner and for doing it to Egypt.

I would like also to thank Professor Ayman Mohamed Ismail for his critical remarks. The comments he gave are very fruitful and added a great value to my work.

Thank you to my family for worrying so and for always being there for me. Thank you my beloved parents for supplication and encouragement. Thank you my beloved aunt Sabreen for permanent supplication. Thank you Ahmed, for providing me with books and dictionaries to improve my English; Hend, for arrangement of my Agenda and encouragement; Zahraa and Ibrahim, for keeping me going during the days and nights of working on

this thesis; my wonderful niece Salma for making me happy all the time, I love you so much.

Last but not least I want to thank all people who showed positive contribution during questionnaire phase. Thanks a lot for those who believed in my work which is a preliminary step towards my waiting future.
