

# ROLE OF MANNOSE-BINDING LECTIN (MBL) LEVELS IN DIAGNOSIS OF NEONATES WITH PNEUMONIA AND SEPSIS

## Thesis

Submitted for Partial Fulfillment of  
Master Degree of Pediatrics

By

**Mohammad Emam Mohammad Abdelgawad**

*M.B.B.Ch 2009*

*Faculty of medicine - Ain Shams University*

Under Supervision Of

**Prof. Mohamed Sami El Shimi**

*Professor of Pediatrics*

*Faculty of medicine - Ain Shams University*

**Dr. Nancy Mohamed Abou Shady**

*Lecturer of Pediatrics*

*Faculty of medicine - Ain Shams University*

**Dr. Marwa Saad Fathi**

*Lecturer of Microbiology & Immunology*

*Faculty of medicine - Ain Shams University*

Faculty of Medicine  
Ain Shams University  
2014

# Acknowledgement

*First and foremost, I would like to give thanks to **ALLAH** the almighty.*

*I wish to express my deep gratitude to **Prof. Sami El Shimi**, Professor of Pediatric, Faculty of medicine- Ain Shams University, for giving me the chance to work under his supervision and give me from his precious time, guidance and support.*

*I also extend my thanks and appreciation to **Dr. Nancy Abou Shady**, Lecturer of Pediatric, Faculty of medicine- Ain Shams University, for her invaluable guidance, constructive criticism and great help in supervising this work.*

*Also I would like to extend my warmest gratitude to **Dr. Marwa Saad Fathi**, Lecturer of Microbiology & Immunology, Faculty of medicine- Ain Shams University, her hard and faithful efforts have helped me to do this work.*

***@Mohammad Emam Mohammad Abdelgawad***

وَأَنْزَلَ اللَّهُ عَلَيْكَ  
الْكِتَابَ وَالْحِكْمَةَ  
وَعَلَّمَكَ مَا لَمْ تَكُنْ  
تَعْلَمُ وَكَانَ فَضْلُ  
اللَّهِ عَلَيْكَ عَظِيمًا

صدق الله العظيم

## Introduction

**N**eonatal sepsis is a major problem across the world. Infections are a major contributor to neonatal deaths in developing countries. Majority of these deaths occur at home without coming to medical attention. The child survival cannot be achieved without substantial reductions in infection-specific neonatal mortality (*Thaver and Zaidi, 2009*).

Around 1 million deaths a year occurring in the neonatal period (0-28 days) are caused by infection, accounting for over 25% of global neonatal deaths and 10% of all mortality in infants under the age of 5 (*Black et al., 2010*).

It is classified as ‘early-onset’ if it occurs within the first 7 days of life and as ‘late-onset’ if it occurs after this time. Typically, early-onset sepsis is considered maternally-acquired, usually from the maternal genital tract, and late-onset sepsis is generally regarded to originate from the care giving environment – either a health care or community setting. Consequently early- and late-onset sepsis are also associated with different distributions of pathogens (*Zaidi et al., 2005*).

The complement system helps or “complements” the ability of antibodies and phagocytic cells to clear pathogens from an organism. It is part of the immune system called the innate immune system (*Janeway et al., 2001*). That is not adaptable and does not change over the course of an individual's lifetime. However, it can be recruited and brought into action by the adaptive immune system.

The complement system consists of a number of small proteins found in the blood, generally synthesized by the liver, and normally circulating as inactive precursors (pro-proteins). When stimulated by one of several triggers, proteases in the system cleave specific proteins to release cytokines and initiate an amplifying cascade of further cleavages. The end-result of this activation cascade is massive amplification of the response and activation of the cell-killing membrane attack complex. Over 25 proteins and protein fragments make up the complement system, including serum proteins, serosal proteins, and cell membrane receptors. They account for about 5% of the globulin fraction of blood serum (*Abbas et al., 2010*).

Three biochemical pathways activate the complement system: the classical complement pathway, the alternative complement pathway, and the lectin pathway (*Abbas et al., 2010*).

The human collectin, mannose binding lectin (MBL) is one of the important components of the innate immunity (*Bouwman et al., 2006*). It provides first line of defence by its ability to bind sugar residues on the bacterial surface through its carbohydrate recognition domain and activates the complement pathway leading to lysis of bacteria independent of antibody (*Dommett et al., 2006*).

## Aim of the Work

**T**o evaluate Role of serum mannose binding-lectin in diagnosis of neonatal pneumonia and sepsis.

## Neonatal Sepsis

### Definition:

**N**eonatal sepsis or septicaemia is a clinical syndrome characterized by systemic signs of circulatory compromise (e.g., poor peripheral perfusion, pallor, hypotonia, poor responsiveness) caused by invasion of the bloodstream by bacteria in the first month of life. In the pre-antibiotic era neonatal sepsis was usually fatal. Case fatality rates in antibiotic treated infants now range between 5% and 60% with the highest rates reported from the lowest- income countries (*Thaver and Zaidi, 2009*).

The World Health Organization (WHO) estimates that 1 million deaths per year (10% of all under-five mortality) are due to neonatal sepsis and that 42% of these deaths occur in the first week of life (*Healy and Baker, 2007*).

There are wide disparities in neonatal care between high- and low-income countries. In high-income countries the major concern is the increasing numbers of extremely premature infants with high nosocomial infection rates due to multi-resistant organisms in intensive care units. Health facility infections are also a major problem in low- income countries, but the more pressing issues are the high proportion of home deliveries in unclean environments predisposing to sepsis and ensuring that all neonates have access to effective interventions from health care providers in the first days of life. Indeed, new strategies that can prevent, diagnose, and treat neonates with sepsis are needed in both low- and high-income settings (*Karen and Anita, 2010*).

## Pathogenesis:

### **A-Risk factors:**

#### ***1. Prematurity and low birth weight:***

The most important neonatal factor predisposing to infection are prematurity and LBW. Preterm infants have 3- to 10-folds higher incidence of infection than full-term normal birth weight infants (*Stoll, 2007*).

#### ***2. Premature rupture of membrane (PROM) & chorioamnionitis:***

Uncomplicated ROM lasting longer than 24 hours has been associated with a 1% incidence of neonatal sepsis above the baseline rate of 0.1% to 0.5% (*Edwards, 2006*). The bacteria that cause neonatal sepsis are acquired shortly before, during, and after delivery (*Edmond and Zaidi, 2010*).

#### ***3. Maternal peripartum fever:***

Fever  $\geq 38^{\circ}\text{C}$  or infection, Chorioamnionitis, urinary tract infection (UTI), vaginal colonization with GBS, previous delivery of a neonate with GBS disease, perineal colonization with E. coli and other obstetric complications (*Naglie, 2004*).

#### ***4. Amniotic fluid problem.***

Meconium-stained or foul-smelling, cloudy amniotic fluid (*Naglie, 2004*).

#### ***5. Resuscitation at birth.***

Perinatal asphyxia, defined as a 5-minute Apgar score of less than 6, in the presence of prolonged ROM has been

associated with an increased incidence of sepsis (*Edwards, 2006*).

## **B. Causative agents:**

In Egypt, a study done by *Abdelhady and Zaki (2003)* showed that causative organism of neonatal sepsis were as follow: *Staphylococcus aureus* (10.3%), Coagulase negative *Staphylococci* (6.9%), Methicilin Resistant *Staphylococcus Aureus* (MRSA) (6.9%), and *Streptococcus fecalis* (3.5%). *Klebsiella pneumonia* was the commonest gram-negative organism (41.3%) followed by *Pseudomonas* (13.8%), *E coli* (10.3%), *Serratia marscense* (3.5%) and *Enterobacter* (3.5%).

In addition, *Ali et al (2006)* found that *Klebsiella pneumonia* was the commonest causative organism in neonatal sepsis (88%). Other organisms causing neonatal sepsis were as follows: *Pseudomonas aeruginosa* (3.9%), *Enterobacter* (3.9%), Coagulase negative *staphylococci* (3.9%) and fungi (3.9%).

The pathogens most often implicated in neonatal sepsis in developing countries differ from those seen in developed countries. Overall, Gram negative organisms are more common and are mainly represented by *Klebsiella*, *Escherichia coli*, *Pseudomonas*, and *Salmonella*. Of the Gram positive organisms, *Staphylococcus aureus*, coagulase negative *staphylococci* (CONS), *Streptococcus pneumoniae* are the most commonly isolated (*Vergnano et al., 2005*).

Neonatal meningitis in developing countries is a serious problem, with a mortality of 33–48% The pathogens involved are similar to those associated with sepsis, mainly Gram negative organisms such as *Klebsiella*, *E coli*, *Serratia marscesens*, *Pseudomonas*, and *Salmonella*, and among the

Gram positive organisms Staph aureus and coagulase negative staphylococci (CONS) (*Vergnano et al., 2005*).

## Classification:

In newborns, sepsis can be either “early-onset” or “late-onset.” Early-onset sepsis (EOS) occurs in the first 3 to 7 days of life and is usually caused by microorganisms from the mother. Late onset sepsis (LOS) occurs after the first week of life, can be from the mother or the environment, and has a higher incidence of meningitis (though mortality is usually less than with early-onset infections (Table 1) (*Rubarth, 2010*).

**Table (1):** Classification of neonatal sepsis:

	Early onset sepsis	Late onset sepsis
<b>Incidence</b>	1.5 %	25%
<b>Time of presentation</b>	Usually within first 12 h Usually the first 3-7d of life	Usually term infant older than 1 wk
<b>Most common pathogens</b>	Escherichia coli Group B streptococci	Coagulase-negative staphylococci
<b>Onset</b>	Fulminant	Subtle
<b>Type of infection</b>	Pneumonia and sepsis (multisystem)	Meningitis with sepsis (focal)
<b>Most acquired from</b>	Mother`s birth canal (OB complication)	Environmental (rarely OB complication)
<b>Infant gestation</b>	Majority term, but preterm unusually susceptible	Majority term
<b>Mortality rate</b>	15-20% or higher with preterms	10-20%
<b>Morbidity</b>	Less long term issues	Late neurodevelopmental sequele
OB indicates obstetric		

(*Rubarth, 2010*)
