

RECENT TRENDS IN DIAGNOSIS AND TREATMENT OF MULTIFOCAL CHOROIDOPATHIES

Essay

*Submitted for Partial Fulfillment of Master Degree
in Ophthalmology*

Presented By

Hadeer Ahmed El-Sherbiny

M.B.B.Ch.

Supervisors

Prof. Dr. Sherif Elwan

*Professor of Ophthalmology
Faculty of Medicine - Ain Shams University*

Dr. Tamer Fahmy Eliwa

Lect

بِسْمِ اللَّهِ الرَّحْمَنِ الرَّحِيمِ

وَأَنْزَلَ اللَّهُ عَلَيْكَ
الْكِتَابَ وَالْحِكْمَةَ
وَعَلَّمَكَ مَا لَمْ تَكُنْ
تَعْلَمُ وَكَانَ فَضْلُ
اللَّهِ عَلَيْكَ عَظِيمًا

صدق الله العظيم

سورة النساء الآية (١١٢)

*I would like to express my endless gratitude and appreciation to my eminent professor, **Prof. Dr. Sherif Elwan**, Professor of Ophthalmology, Faculty of Medicine - Ain Shams University, for giving me the honor to work under his supervision and from whom I did learn a lot. He encouraged me, removed all the obstacles from my way and pushed me to achieve success.*

*My sincere thanks to **Dr. Tamer Fahmy Eliwa**, Lecturer of Ophthalmology, Faculty of Medicine - Ain Shams University, for his continuous guidance, honest help and endurance that made this essay come to light.*

*Also I would like to thank my **Family** who stood behind me to finish this work and for their great support.*

✍ Hadeer Ahmed El-Sherbiny

List of Contents

<i>Title</i>	<i>Page No.</i>

List of Figures	v
Introduction	1
Chapter (1): Anatomy	5
Chapter (2): multifocal choroidopathies.....	12
Chapter (3): Conditions simulating multifocal choroidopathies.....	36
- Infectious entities	36
- Noninfectious entities	44
Chapter (4): Key for Diagnosis	61

List of Abbreviations

AMD	Age related macular degeneration
AAV	Adeno associated virus
AGEs	Advanced glucation end product
AMN	Acute macular neuroretinopathy
APMPPE	Acute posterior multifocal placoid pigment epitheliopathy
ARPE	Acute retinal pigment epitheliitis
AZOO	Acute zonal occult outer retinopathy
BM	Bruch's membrane
BRMs	Biological response modifiers
CME	Cystoid macular oedema
CNV	Choroidal neovascularization

List of Abbreviations

IL	Interleukin
IOP	Intraocular pressure
LD	Lyme disease
LP	Laser photocoagulation
LP	Laser photocoagulation
MCP	Multifocal choroiditis and panuveitis
MEWDS	Multiple evanescent white dot syndrome
mfERG	Multifocal ERG
MMF	Mycophenolate mofetil
OCT	Optical coherence tomography
OHS	Ocular histoplasmosis syndrome
PAS	Peripheral anterior synechiae
PDT	Photodynamic therapy

List of Abbreviations

TGF	Transforming growth factor
TNF	Tumor necrosis faction
TNF-a	Tumor necrosis factor-a
t-PA	Tissue plasminogen activator
VA	Visual acuti y
VEGF	Vascular endothelial growth factor
VKH	Vogt–Koyanagi–Harada

INTRODUCTION

M*ultifocal Choroidopathies* or white dot syndromes are a group of rare disorders involving a primary pathologic process occurring at or near the level of the retinal pigment epithelium (RPE) with or without choriocapillaris involvement. [1]

The white dot syndromes consist of the predominantly noninfectious ocular syndromes including multiple evanescent white dot syndrome (MEWDS), acute posterior multifocal placoid pigment epitheliopathy (APMPPE), Birdshot retinochoroidopathy, Serpiginous choroiditis, multifocal choroiditis and panuveitis (MCP), punctate inner choroidopathy (PIC), subretinal fibrosis and uveitis syndrome (SFU), acute retinal pigment epithelitis (ARPE), acute zonal occult outer retinopathy (AZOOR), acute macular neuroretinopathy (AMN), relentless placoid chorioretinitis (RPC) and unifocal helioid choroiditis. [2]

The etiology of the white dot syndromes is unknown. Most of the diseases subsumed under the white dot syndromes share an association with systemic infectious diseases, such as viral infections, toxoplasmosis, or tuberculosis. In many cases, an intensive medical and infectious workup is indicated. [3]

Others have suggested an autoimmune/inflammatory pathogenesis arising among individuals with common non-disease-specific genetics, triggered by some exogenous agents. Although they have similarities, the white dot syndromes can be differentiated clinically based on their variable lesion morphology and evolution, distinct natural histories, and angiographic behavior. [4]

Many different genetic mutations are involved, in different combinations and to varying degrees. Some genetic factors, such as HLA(Human Leukocytic Antigen)-A29 have strong association with birdshot retinochoroidopathy, others as HLA-DR2 and HLA-B7 has elevated prevalence in the patients of APMPE.[5]

Common presenting symptoms include photopsia, blurred vision, nyctalopia, floaters, and field loss contiguous with a blind spot. In many cases, a prodromal viral syndrome can be identified. Bilateral involvement, albeit asymmetrically (with the exception of MEWDS), is the rule. Other than patients with birdshot retinochoroidopathy and serpiginous choroidopathy, the majority of individuals are younger than 50 years of age. A female predominance is more commonly observed in patients with MEWDS, birdshot retinochoroidopathy, MCP, PIC, and AZOOR. [3]

The inflammatory chorioretinopathies, or white dot syndromes, are a heterogeneous group of inflammatory

disorders with overlapping clinical features that share the common presence of discrete, multiple, well-circumscribed yellow-white lesions at the level of the retina, outer retina, RPE, choriocapillaris, and choroid during some phases of their disease course. [6]

Their differential diagnosis includes systemic and ocular infectious entities such as tuberculosis, syphilis, diffuse unilateral subacute neuroretinitis (DUSN), Lyme disease and ocular histoplasmosis syndrome (OHS), as well as noninfectious entities such as central serous chorioretinopathy (CSC), sarcoidosis, sympathetic ophthalmia (SO), Vogt-Koyanagi-Harada (VKH) syndrome, idiopathic uveal effusion syndrome and intraocular lymphoma. [7]

Although some of these disorders are self-limited and have good visual outcomes, others are associated with serious retinal and choroidal sequelae and can result in visual loss. This has important implications with respect to disease-specific indications for treatment and predictions of the ultimate visual prognosis. [8]

The aim of ocular inflammatory treatment is to prevent visual loss, discomfort and ocular morbidity. Understanding the pathogenesis and progression of uveitis is important for targeted therapies with greater efficacy and less side effects for the most cases of ocular inflammatory diseases. [9]

There are different treatment modalities for this wide group of diseases, including medical treatment in form of corticosteroids, immunosuppressive drugs, anti VEGF (vascular endothelial growth factor) drugs, laser photocoagulation (LP), photodynamic therapy (PDT), and surgical treatment.

The recent modalities include tissue plasminogen activator, maculoplasty, retinal pigment epithelium replacement therapy and gene therapy. **[4]**

ANATOMY OF THE CHOROID

Choroid is a thin but highly vascular membrane lining the inner surface of sclera. It extends from anteriorly ora serrata to the optic nerve posteriorly. It has a rough outer surface which is attached to sclera at the optic nerve and at the exit of the vortex veins. The smooth inner surface of choroid is attached to the retinal pigmented epithelium (RPE). Choroid becomes continuous with pia and arachnoid at the optic nerve. The choroid is qualitatively assessed with fluorescein angiography and even better with ICG angiography that explores the choroidal vasculature and the different originating pathologies. The quantitative assessment is yet clinically performed with OCT, Choroid normally ranges from 287 ± 74.2 to $345 \pm 111 \mu$ depending on the instrument, the OCT technique, of the delineation of the choroidal limit, thickness is highest at macula 500- 1000 μ m. Choroidal thickness increases in intraocular inflammation. The smooth configuration of choroid can be observed ophthalmoscopically in choroidal detachment. [10]

Microscopic structure of choroid:

Choroid is composed predominantly of blood vessels surrounded by melanocytes, nerves and connective tissue. Choroid can be divided into the following layers histologically:
