Unit, National Research Centre**

**Name of Candidate:** Fatma Abd El-Rhman Abd El-Wahab **Degree:** M.Sc.

**Title of Thesis:** Evaluation of produced bio-diesel from fish wastes oil.

**Supervisors:** Dr. Sami Mohamed Younis

Dr. Nesreen Samir Mahmoud

Dr. Abo El - Khair Badawy El-Sayed

**Department:** Agricultural Engineering

**Approval:** 31 / 3 / 2018

### **ABSTRACT**

The search on alternative fuels for compression ignition engine has become essential due to depletion of petroleum products, their increasing costs and its major contribution for pollutants. Biodiesel has become one of the most versatile alternative fuel options for diesel engine applications. Most researchs on biodiesel have focused on using plant based oils as feed stocks. There have been much less researchs on converting animal-based oils into biodiesel. One potential source of biodiesel is fish oil. The objective of this study was to produce and evaluate using Tilapia viscera biodiesel as a substitute for petrodiesel in compression ignition engine. Experiments were designed to investigate three points, the first was to study the applicability of producing and characterizing of oil from Tilapia viscera, the second point was to investigate the applicability of producing biodiesel from Tilapia visceral oil and characterizing and the third was to study the performance characteristics as fuel consumption, brake specific fuel consumption, brake thermal efficiency and the opacity of a six cylinder, direct injection diesel engine using B20 (20% Tilapia viscera biodiesel with 80% petrodiesel). The results showed that fish waste (Tilapia viscera) can be converted to oil with percentage about 22%, and the characteristics of oil were a good indicator for the applicability of producing biodiesel. The results also reached that biodiesel can be produced from extracted oil from Tilapia viscera and this biodiesel was characterized by physicochemical properties and the properties were compared with international biodiesel standard specifications. The results revealed acceptable performance parameters of the engine by using B20. It was found that Fuel Consumption increases as the load increases. The Fuel Consumption of B20 was slightly higher than petrodiesel with average difference 2.4%. Brake Specific Fuel Consumption for B20 was higher than petrodiesel nearly 6.73% as average. Brake thermal efficiency for B20 was slightly lower than petrodiesel with average difference 5.2%. The results of environmental assessment showed that The Opacity of petrodiesel and B20 was 3.75% and 2.85% respectively, opacity of B20 was 24% lower than petrodiesel. Costs of using B20 increased nearly by 80 piasters (4.5 cents) comparing with petrodiesel for one liter.

**Keywords:** Fish waste, Biodiesel, Alternative fuel, Diesel engine, Opacity.

## DEDICATION

*I would like to take this opportunity to thank all the persons who helped me in completing this work, but first I would like to praise and give a great thank to ALLAH who granted me to complete this work. My special gratitude goes to my father “may his soul rest in peace” for his love, encouragement and who is the person that I owe for him that I became in this work, he always says to me “I hope to be better than me and achieve what I couldn’t achieve through my life”. There are no words to express my love and gratitude to my mother for her support, sympathy. She always asks ALLAH to help me to carry out this work, I also hope to thank brothers, my sisters and my fiancée for all the support they lovely offered during my post-graduate studies and to my best friends.*

## ***ACKNOWLEDGEMENT***

*The author wishes to express his sincere thanks and appreciation to **Dr. SAMY MOHAMED YOUNIS**, professor of Agricultural Engineering, faculty of Agriculture, Cairo University, for his sincere supervision, encouragement, guidance and constructive criticism through this work was undertaken. To **DR. NESREEN SAMIR MAHMOUD**, assistant professor of Agricultural Engineering, faculty of Agriculture, Cairo University, for her continuous advice, friendly attitude and help during the course of this work. To **Dr. Abo El - Khair Badawi El - Sayed**, Head of Fertilization Technology Department, Head of Algal biotechnology Unit, National Research Centre for sharing in supervision and all supports that was offered me. Thanks are also extended to the staff members of the Agricultural Engineering Department, Faculty of Agriculture, Cairo University. I would like to thank all members of Misr Petroleum Research Center (MPRC) specially all members of fuel analysis sector and performance sector. finally I would like to thank all members of Algal Biotechnology Unit, Fertilization Technology Department, National Research Centre for helping me and their collaboration on my research.*

## **LIST OF ABBRIVIATIONS**

ANOVA	Analysis of variance
ASTM	American Society for Testing and Materials
ASTM D6751	Biodiesel standard ASTM D6751 (United States)
B5	Biodiesel with 5% biodiesel in blend with petrodiesel
B10	Biodiesel with 10 % biodiesel in blend with petrodiesel
B20	Biodiesel with 20%biodiesel in blend with petrodiesel
B25	Biodiesel with 25 % biodiesel in blend with petrodiese
B50	Biodiesel with 50 % biodiesel in blend with petrodiesel
B60	Biodiesel with 60 % biodiesel in blend with petrodiese
B75	Biodiesel with 75 % biodiesel in blend with petrodiese
B80	Biodiesel with 80 % biodiesel in blend with petrodiese
B100	Biodiesel with 100% biodiesel in blend with petrodiesel

# INTRODUCTION

The world is on the brink of energy crisis. The need for energy is increasing with the development of technology. This needed energy should be supplied from fossil based sources (coal, petroleum and natural gas) or from other alternative sources (solar, wind, geothermal, biogas, hydrogen). The limited fossil fuel sources are unable to cover for the continuously increasing demand of energy. This associated with increasing price of fossil fuels and the awareness of the impacts of environmental pollution and global warming, has forced a search for an alternative source of energy, which is renewable, safe and non-polluting.

Almost all countries are dependent on petroleum fuel to fulfil their energy requirements. Increase in energy demand due to growth in population has affected the underground fossil fuel resources. Since compression ignition (CI) engines are more widely used compared to spark ignition (SI) engines, greater attention is being devoted to develop an alternative source of fuel for the same.

Biodiesel is one of the potential alternatives to petrodiesel, as its properties are very comparable to petrodiesel. It is derived from the transesterification of vegetable oils, animal fats, or waste frying oils with alcohols to give the corresponding fatty acid methyl esters.

The most preferred raw materials for biodiesel are vegetable oil, animal oil and waste oil. Producing biodiesel from edible oils

may leave negative effect on agriculture in terms of scarcity of food crops so non-edible oils are preferred for production of biodiesel. Used cooking oil collected from restaurants is cheaper but it is a limited and unstable source for biodiesel production. Algae have promising potential however, it is still under study. The search for different kinds of low-cost feed stocks is the first step towards establishing a long-term commercially viable and sustainable biodiesel industry (Xiaohu *et al.*, 2010).

The fish processing industry generates large quantities of tissue waste and by-products which tend to be either discarded or retailed at low value for fertilizer or animal feed. Another way to utilize from these by products is to transesterify the fish oils for the purpose of using in internal combustion engines. Many studies were carried out for fish oil as fuel for diesel engines (Lin and Li, 2009a).

Fish is an important source of high quality animal protein, essential fatty acids, and micronutrients, which are found at much higher level in fish than in terrestrial animals source foods. The fish sector is very important not only to ensure food security but also to improve employment and income for poverty elimination especially in developing countries. Egypt is the largest aquaculture producer in Africa and the 8th largest globally. The Egyptian aquaculture increased from 367,000 tonnes in year 2002 to 1,018,000 tonnes in year 2012, to 1.48 million tonnes in 2014, and to 1.53 million tonnes in 2015 (GAFRD, 2002-2015) .
