# **Tissue Factor Pathway Inhibitor in Pediatric Patients with Nephrotic Syndrome**

## **By**

**Rania Saleh Beltagi**

### **ABSTRACT**

**Background:** Tissue factor pathway inhibitor (TFPI) is the major down regulator of the procoagulant activity of the TF/FVIIa complex. The mature TFPI protein, previously known as lipoprotein-associated coagulation inhibitor (LACI) or extrinsic pathway inhibitor (EPI), has a molecular weight of 34.000.

**Aim:** to monitor the level of TFPI in blood and urine in children with nephrotic syndrome . Correlation with activity of the disease, response to therapy and the degree of hypoproteinemia & proteinuria will be assessed .

**Methods:** Fifteen nephrotic patients in relapse (proteinuria $>40\text{mg}/\text{m}^2/\text{hour}$ , hypoalbuminemia, and edema) before initiating steroid therapy (Group I), and another 15 nephrotic patients in remission after withdrawal of steroid therapy (Group II) were compared to 15 age- and sex-matched healthy children. Besides clinical evaluation and routine laboratory investigations of nephrotic syndrome, tissue factor pathway inhibitor in plasma were measured by ELISA.

**Results:** Plasma TFPI level was higher in nephrotic patients [  $(102.53\pm14.23)$  and  $(82.93\pm3.83)\text{ng}/\text{ml}$  in both proteinuria & remission groups respectively] than control group  $(62.40 \pm 7.53) \text{ ng}/\text{ml}$  with highly significant statistical difference

( $p < 0.0001$ ), and higher in proteinuria group than the remission group with highly significant statistical difference ( $p < 0.0001$ ). There was a negative correlation between plasma TFPI level and total protein (strong association) ( $p = 0.0001$ ), serum albumin (strong association) ( $p = 0.0001$ ) and there was a positive correlation between plasma TFPI level and urine protein /creatinine ratio (moderate association) ( $p = 0.05$ ) with significant statistical difference ( $p < 0.05$ ).

**Conclusion:** Nephrotic syndrome was associated with increased level of plasma tissue factor pathway inhibitor in comparison to control group and the increase was more apparent in patients with active disease. There was a negative correlation between plasma TFPI level and total serum protein, and serum albumin, while there was a positive correlation between plasma TFPI level and urine protein/creatinine ratio.

## **Acknowledgement**

*Thanks to Allah the greatest of all for helping me to complete this work.*

*I would like to express my sincere and deep gratitude to **Prof. Dr. Farida Ahmed Farid**, Professor of Pediatrics, and pediatric nephrology, Faculty of Medicine, Ain Shams University, for giving me the privilege of supervising this thesis and for her constructive encouragement, illuminating guidance as well as her support throughout this work.*

*I am really very grateful and deeply indebted to **Dr. Ahmed Abdullah Mohammad**, Assistant professor of Pediatrics, Faculty of Medicine, Ain Shams University, for his unfailing help, valuable suggestions and good support which helped me to put this work in its best form. It was a great honor and a chance of a lifetime to work with him.*

*I really wish to express my deep gratitude to **Prof. Dr. Hanaa Mohammad EL-Said Afify**, professor of clinical pathology, Faculty of Medicine, Ain Shams University, for her kind assistance, precious and effective effort.*

*I wish to express my deep thanks to the children in nephrology and out patient clinics -children hospital, Ain Shams University.*

# Introduction

Nephrotic syndrome is the most common cause of generalized edema in children above the age of 2 years. Diagnosis is confirmed by the presence of massive proteinuria, hypoproteinemia and hyperlipidemia (*Orth and Ritz, 1998*).

A hypercoagulable state with the risk of thromboembolism in both arterial and venous circulation is a relatively frequent and serious feature of nephrotic syndrome in children (*Citak et al., 2000*).

Tissue factor (TF) is a transmembrane procoagulant glycoprotein and a member of the cytokine receptor superfamily. TF functions as a protein cofactor for FVIIa. The TF/FVIIa complex then activates both factor IX and X leading to thrombin generation and fibrin formation (*Lopes-Bezerra and Filler, 2003*).

Tissue factor pathway inhibitor (TFPI) is a natural inhibitor that regulates the initiation of coagulation by inhibiting tissue factor-activated factor VII(TF-FVIIa) in
