ACKNOWLEDGEMENT

First of all, thanks to Allah who granted me the ability to perform this work.

I am deeply indebted to **Prof. Dr. Khalid Talaat Khairy**, Professor of Diagnostic
Radiology, Faculty of Medicine, Ain Shams
University, under whose supervision this work
was produced and to whom I would like to express
my gratitude for his assistance and guidance
throughout this work.

I would also like to express my grateful appreciation to **Dr. Mohammed El-Gharib Aboulmanty**, Lecturer of Diagnostic Radiology,

Faculty of Medicine, Ain Shams University, for his valuable help throughout planning and completing this work.

Lastly I would like to thank my proffessors, family and all my colleagues for their continuous support and advice.

Introduction and aim of work

Introduction:

The incidence of melanoma is increasing more rapidly than any other malignancy (Rigel and Carucci, 2000) Melanoma currently ranks as the fifth most common cancer, with an Although melanoma most commonly metastasizes to regional lymph nodes, mortality from melanoma is due primarily to distant spread to visceral organs, commonly the lung, liver and brain (Blach et al., 2001), Long – term survival is excellent for patients diagnosed with in situ and early invasive disease, making an early diagnosis and accurate staging extremely important in the management of melanoma (Lange and Blach, Y . . 7).

For many years, computed tomography (CT), and to a lesser extent magnetic resonance imaging (MRI), have been the principal modalities used for imaging metastatic melanoma, however, the advent of positron emission tomography (PET), and more recently PET/CT, has raised new questions as to be the optimal imaging management strategy for the this disease, as they combine the ability to detect active metabolic processes and their morphologic features in a single exam, so it play important role in staging and restaging of malignant melanoma (Gambhir, Y . . Y).

FDG-PET is of limited use in patients with early-stage disease without nodal or distant metastases (stage I-II), but FDG-
