

**SOME STUDIES ON THE FACTORS OF PATHOGENIC
DETERMINANTS OF STAPHYLOCOCCUS AUREUS
ISOLATED
FROM BOVINE MASTITIS**

A Thesis

Presented to the Graduate School
Faculty of Veterinary Medicine, Alexandria University

In Partial fulfillment of the
Requirements for the Degree

Of
Master of Veterinary Sciences

In
Microbiology

Specialization (Bacteriology and Mycology)

By
Saad El-Said Amer Kotb

بعض الدراسات عن عوامل الضراوة لميكروب المكور العنقودى الذهبى المعزول من
إلتهاب الضرع فى الماشية

رسالة علمية

مقدمة إلى الدراسات العليا بكلية الطب البيطرى - جامعة الأسكندرية
إستيفاء للدراسات المقررة للحصول على درجة

ماجستير العلوم الطبية البيطرية

فى

الميكروبيولوجيا

تخصص (بكتريولوجيا و فطريات)

مقدمة من

ط.ب./ سعد السيد عامر قطب

Advisors' Committee

Prof. Dr. Mohamed Ali Akiela

Professor of Microbiology
Head of Microbiology Department
Faculty of Veterinary Medicine
Alexandria University

Prof. Dr. Riad Hassan Khalil

Professor of Fish and Crustacean Diseases
Head of Poultry and Fish Diseases
Department
Faculty of Veterinary Medicine
Alexandria University

لجنة الإشراف

الأستاذ الدكتور / محمد على عقيلة

أستاذ الميكروبيولوجيا
رئيس قسم الميكروبيولوجيا
كلية الطب البيطرى
جامعة الإسكندرية

الأستاذ الدكتور / رياض حسن خليل

أستاذ أمراض الأسماك و القشريات
رئيس قسم أمراض الدواجن و الأسماك
كلية الطب البيطرى

وما أوتيتم من العلم إلا قليلاً

صدق الله العظيم

سورة الإسراء الآية رقم ٨٥

**Dedicated To
My Parents
My Sisters & My Brother**

ACKNOWLEDGMENT

*First of all, my deepest prayerful thanks to **Allah** for giving me the strength and ability to accomplish this work and for everything I have been given in all my life.*

*It is really difficult to find suitable words to express my sincere gratitude to **Professor Dr. Mohamed Ali Akiela**, Professor of and Head of Microbiology Department, Faculty of Veterinary Medicine, Alexandria University for his scientific supervision, help and kind advice.*

*I would like to express my deep appreciation to **Professor Dr. Riad Hassan Khalil**, Professor of Fish and Crustacean Diseases, and Head of Poultry and Fish Diseases Department, Faculty of Veterinary Medicine, Alexandria University for his unfailing help and supervision throughout this work.*

*I wish to express my deepest thanks to **Professor Dr. Abdel-Rasheed Fathy Ghanem**, Deputy of Animal Health Research Institute, Agriculture Research Center, Dokki, Giza, for his valuable cooperation, interest and encouragement during the fulfillment of this study.*

*I am also deeply indebted and grateful to **Professor Dr. Helmy A. Torky**, Professor of Microbiology, Faculty of Veterinary Medicine, Alexandria University for his help, advice, and continuous encouragement.*

*Great thanks and appreciation to **Professor Dr. Samy A. Khaleil**, Professor of Microbiology, Faculty of Veterinary Medicine, Alexandria University for his sincere support and guidance throughout this work.*

All of my sincere appreciation to all members of the Department of Microbiology, Faculty of Veterinary Medicine, Alexandria University for their help and the facilities they provided during the study.

Finally, I would like to express my special thanks to my parents, and my family for the encouragement and support given to me to fulfill this work, and for help throughout my life.

LIST OF ABBREVIATIONS

γ-DE	γ-D electrophoresis
APHA	American Public Health Association
bp	Base pair
CLFa	Clumping factor
CMT	California mastitis test
CNS	Coagulase negative staphylococci
Coa	Coagulase gene
CPS	Coagulase positive staphylococci
CRF	Coagulase reacting factor
DDW	Double-distilled water
dNTPS	Deoxynucleotide triphosphate solution
EDTA	Ethylene diamine tetra-acetic acid
ET	Exfoliative toxin
Fnb	Fibronectin binding A
FSF	Fibrin stabilizing factor
hla	Alpha-haemolysin
hlb	Beta-haemolysin
IMI	Intramammary infection
Luk	Leukocidin gene
MLST	Multilocus sequence typing
mPCR	Multiplex polymerase chain reaction
nuc	Thermonuclease gene
O-F	Oxidation-Fermentation
PAGE	polyacrylamide gel electrophoresis.
PCR	Polymerase chain reaction
PFGE	Pulse field gel electrophoresis
RFLP	Restriction fragment length polymorphism
RPLA	Reverse passive latex agglutination assay
rRNA	Ribosomal ribonucleic acid
S.	Staphylococcus
SCC	Somatic cell count
SDS	Sodium dodecyle sulphate
SE	Staphylococcal enterotoxin
SEA	Staphylococcal enterotoxin A
Sp.	Species
Spa	Staphylococcal protein A
Str.	Streptococcus
TCT	Tube coagulase test
TE	Tris-EDTA
TM	Melting temperature
TPE	Tris-phosphate EDTA
TSST-I	Toxic shock syndrome toxin-1
Tth	Thermus thermophilus

TABLE OF CONTENTS

INTRODUCTION

Worldwide bovine mastitis is the most common infectious disease affecting milk producing cows causing economic losses higher than any other disease of dairy cattle (**Gillespie and Oliver, 1999**). Also, it possesses food safety and anti-microbial resistance threats (**Kim et al., 2001**), as it is the primary contamination source of milk and milk products especially in case of defective pasteurization (**Joffe and Baranovics, 2007**).

The major causes of bovine mastitis are *Staphylococcus (S.) aureus*, *Str. agalactiae*, *Str. dysgalactiae*, *Str. ubris* (**Phuektes et al., 2001**). *S. aureus* is recognized worldwide as a major pathogen causing subclinical intramammary infections in dairy cows (**Salasia et al., 2004**).

Identification of bacterial pathogens in milk from cows with mastitis is the definitive diagnosis of mastitis infections. It also provides information important for prevention and control of the disease. In most clinical laboratories identification methods are based on microbiological culture of milk and biochemical identification of bacterial isolates recovered. However, these microbiological cultures are limited by the dynamic nature of infections. Subclinically infected cows are intermittent shedders of organisms through low and high shedding patterns during lactation leading to negative cultures (**Phuektes et al., 2001**).

In bovine mastitis, coagulase positive staphylococci (CPS) (*S. aureus* and some strains of *S. hyicus*) are common pathogenic than coagulase negative staphylococci (CNS) isolates (**Ali-Vehmas and Sandholm, 1999**). The TCT has the potential to detect not only *S. aureus* but also other CPS in milk.

The ability of *S. aureus* to form clumps in the presence of plasma has been known since the turn of the century (**Much, 1904**). Staphylococcal components which interact with fibrinogen and can be purified from *S. aureus* culture supernatant fluids have been described. These include a staphylocoagulase and a cell wall protein (clumping factor, CLFa) which binds with fibrinogen (**Boden and Flock, 1997**). Staphylocoagulase, produced by *S. aureus*, form an active molecular complex with prothrombin which converts fibrinogen to a fibrin clot (**Hendrix et al., 1997**). Studies of gene sequences have demonstrated that coagulase and CLFa factor are genetically distinct (**McDevitt et al., 1997**). Detection of staphylocoagulase and CLFa are used for identification of *S. aureus* in diagnostic laboratories (**Kloos and Schleifer, 1997**). Molecular epidemiological analysis of bovine *S. aureus* population suggested that a small numbers of clonal types were responsible for most infections, and that strains had a broad geographic distribution (**Kalorey et al., 2007**). A better knowledge on the distribution of *S. aureus* in dairy animals might help formulate strategies to reduce the spread of infection (**Salasia et al., 2004**).

The pathogenic staphylococci produce a “battery” of toxins and enzymes (**Quinn et al., 1994**) which make a contribution to the ability of this organism to cause disease on the mammalian host (**Salasia et al., 2004**). These exotoxins include haemolysins, various enzymes and a family related pyrogenic toxins, namely staphylococcal enterotoxin (SE), toxic shock syndrome toxins (TSST) and exfoliative toxins (ET) (**Dinges et al., 2000**). Recently a novel gene cluster encoding staphylococcal exotoxins-like protein has been described (**Williams et al., 2000**).

The analysis of relationship between presence/absence of the different genes and the udder inflammatory response measured by milk somatic cell count (SCC) showed that at least one cluster, which made by classification of isolates in cluster by virulence genes, induced a higher inflammatory response. Moreover, the analysis of the association between virulence genes and the presence of subclinical mastitis, support that it could be related to strain characteristics, and the expression of specific combination of virulence factor specially the *spa* (staphylococcal protein A), *COA* (coagulase gene) and *SEJ* (one of the *SEs*) (**Zecconi et al., ۲۰۰۷**). No remarkable difference was recognized in the identification ratio of the isolates which belonged to the two major lineages between mastitis of subclinical origin and clinical origin (**Hata et al., ۲۰۰۷**).

This work aimed to study some factors of the pathogenic determinants of *S. aureus* isolated from clinical bovine mastitis. This will be accomplished through:

۱. Isolation and classification of staphylococci recovered from samples collected from clinically mastitis cows examined.
۲. Determining the incidence of *S. aureus* in milk samples collected from cases of bovine clinical mastitis.
۳. Studying certain pathogenic determinants of *S. aureus* recovered from clinical mastitis milk. Moreover, identification of *S. aureus* enterotoxin (*SEA*) by using PCR.
