

Efficacy of nebulized colistin versus nebulized
amikacin plus ceftazidime in treatment of ventilator
associated pneumonia caused by Gram negative
multidrug resistant organisms.

M.Sc. Thesis

Submitted for Partial Fulfillment of the M.Sc. Degree in Intensive
Care Medicine

BY

Alia Essam Mostafa Morsi

M.B., B.Ch, Faculty of Medicine, Ain Shams University

Supervised by

Prof. Dr. Omar Mohammed Taha Abdullah El-Safty

Professor of Anesthesiology, Intensive Care Medicine and
Pain Management

Faculty of Medicine, Ain Shams University

Dr. Ahmed Ali Mohammed El-Shebeny

Assistant Professor of Anesthesiology, Intensive Care
Medicine and Pain Management

Faculty of Medicine, Ain Shams University

Dr. Mostafa Mansour Hussein Khalil

Lecturer of Anesthesiology, Intensive Care Medicine and
Pain Management

Faculty of Medicine, Ain Shams University

2017

بِسْمِ اللَّهِ الرَّحْمَنِ الرَّحِيمِ

وَقُلْ عَلَّمَ الْقُرْآنَ

Acknowledgments

*My thanks are submitted first and foremost to **ALLAH**, glory to him who gave me the strength and ability to complete this work.*

*I would like to express my thanks and appreciation to **Prof. Dr. Omar Mohammed Taha Abdullah El-Safty**, Professor of Anesthesiology, Intensive Care and Pain Management, Faculty of Medicine, Ain Shams University, for his candid opinions, timely feedback, insights and the effort and time he has devoted to the fulfillment of this work. I am indebted to him for his guidance and sincere help during the supervision of this study.*

*My sincere gratitude and appreciation are also due to **Dr. Ahmed Ali Mohammed El-Shebeny**, Assistant Professor of Anesthesiology, Intensive Care and Pain Management, Faculty of Medicine, Ain Shams University, for his kind help, constant encouragement, constructive criticism, and the time and effort he dedicated to this work.*

*I can't forget to thank with all appreciation, **Dr. Mostafa Mansour Hussein Khalil**, Lecturer of Anesthesiology, Intensive Care and Pain Management, Faculty of Medicine, Ain Shams University, for the efforts and time he has devoted to accomplish this work.*

*I can't forget to thank all members of my family, especially my **great mother**, for her support and care in every step of my life.*

TABLE OF cONTENTS

List of Abbreviations	IV
List of Tables	VI
List of Figures	VII
1. Introduction	1
2. Aim of the work	3
3. Review of Literature	5
3.1. Pathogenesis of VAP	5
3.2. Risk factors	12
•Duration of mechanical ventilation	13
•Type and frequency of change of ventilator circuits	14
•Role of humidification	14
•Closed versus open ventilation	15
•Nasogastric tube and enteral feeding	15
•Position of the patient	16
•Role of tracheostomy	17
•Re-intubation and use of sedatives and paralytic Agents	18
•Stress ulcer prophylactic drugs	18
•Transport out of ICU	19
3.3. Diagnosis of VAP	21
3.4. Microbiology of causative organisms	21
•Pseudomonas aeruginosa	21
•Klebsiella pneumonia	23
•Acinetobacter baumannii	24
3.5. Pharmacology	27
•Colistin	27
•Colistin units and doses	31
•Amikacin	34
•Ceftazidime	36

3.6. Nebulized antibiotics	37
•Types of nebulizers and positioning	38
4.Patients and Methods	43
•Study design	43
•Inclusion criteria	43
•Exclusion criteria	44
•Study groups	44
•Randomization method	45
•Aerosol generation	46
•Measurements	47
•Ending point of study	49
•Statistical analysis	49
5.Results	51
6.Discussion	66
7.Conclusion	74

List of abbreviations

Abbreviation	Title
ARDS	Adult Respiratory Distress Syndrome
AUC	Area Under Curve
CAP	Community Acquired Pneumonia
CMS	Colistimethate Sodium
CPIS	Clinical Pulmonary Infection Score
CRP	C-Reactive Protein
CT	Computed Tomography
CXR	Chest X Ray
ESBL	Extended Spectrum Beta Lactamase
ETT	Endotracheal Tube
GER	Gastro Esophageal Reflux
GNB	Gram Negative Bacteria
HMEs	Heat and Moist Exchange humidifiers
HVLP	High Volume Low Pressure
ICU	Intensive Care Unit
IU	International Unit
L-Dab	L- diaminobutyric acid
LPS	Lipopolysaccharide
MDR	Multi Drug Resistant

mg	Milligrams
MIC	Minimal Inhibitory Concentration
MV	Mechanical Ventilation
r RNA	Ribosomal Ribonucleic Acid
t RNA	Transfer Ribonucleic Acid
TLC	Total Leucocyte Count
TNF- α	Tumor Necrosis Factor – α
VAP	Ventilator Associated Pneumonia

List OF TaBLE

Table3-1: Clinical Pulmonary Infection Score (CPIS).	20
Table3-2: Initial Empirical Antibiotic Treatment of VAP According to the Potential Pathogen.	25

LisT OF FiGURE

Figure 3-1: a: The in vitro trachea model used in the aspiration of microbial fluid study. The 20 ml syringe was connected to the 10 ml enteral syringe via the tip. The endotracheal tube was placed in the 20 ml syringe. Fluid leaking past the cuff was collected aseptically in the enteral syringe. b: the in vitro trachea model used in the range of tracheas study. The endotracheal tube was placed inside the rigid glass ‘trachea’ and the fluid leaked past the cuff was collected inside the model. 8

Figure 3-2: Electron microscopy of biofilm deposits on the inner tube surface (A). The biofilm deposits are composed of tracheal mucus with polysaccharide matrix (PS) and embedded microorganisms colonizing the trachea (B+C). 9

Figure 3-3: Routes of colonization/infection in mechanically ventilated patients. A – oral and pharyngeal colonization; B – gastric colonization; C – infected patients; D – handling of respiratory equipment; E – use of respiratory devices; and F – aerosols from contaminated air. 9

Figure 3-4: Three-component membrane efflux pump. The pump itself (MexB, MexD, or MexF, according to the system) lies in the cytoplasmic membrane and is attached via a linker lipoprotein (MexA, MexC, or MexE) to the exit portal (OprM, OprJ, or OprN). Efflux system components appear in large roman type; other membrane components appear in small italic type. 23

Figure3-5: Influence of nebulizer position on aerosol loss during expiration. Nebulizer positioning upstream in the inspiratory limb enables the later to act as a reservoir, thereby storing aerosol during expiration for an aerosol 42

bolus delivery at next insufflation.

Figure 5-7: changes of serum creatinine at days 0, 3, 7, 10 of study.	58
Figure 5-8: Changes in lung infiltration in CXR at days 0, 4, 10 of study.	59
Figure 5-9: Changes in lung aeration and inflammation in CT chest at days 0, 10 of study.	60
Figure 5-10: CT chest of female 63yrs old admitted to ICU by disturbed conscious level due to Rt. MCA with left sided hemiplegia, the patient ventilated due to DCL, 3dys later patient suffer fever 38.5°C together with increased TLC, CRP and purulent discharge from ETT. CT chest with contrast done showed bilateral patches of consolidation more on lower lobe on right lung and moderate amount of pleural effusion, this patient was in group B.	62
Figure 5-11: CT chest of the above patient at the end of study show near complete regression of inflammation of right lower lobe of the lung and improved aeration, note near complete regression of right sided pleural effusion, patient successfully weaned of mechanical ventilation at day 5 of study.	63

Figure 5-12: CT chest of male patient, 50 years old, smoker, diabetic drugs, with history of peptic ulcer, admitted to ICU intubated ventilated after urgent abdominal exploration for perforated duodenal ulcer, he was on levophed 100ng/ml. on 4th day post-operative patient developed high grade fever, leukocytosis, and purulent discharge form ETT, CT abdomen with oral contrast showed no leakage but CT chest show bilateral consolidation more on right side and mild right side pleural effusion, this patient was in group A. 64

Figure 5-13: CT chest of the same patient in (figure 5-13) showed worsened chest condition, the both lung became nearly totally infiltrated with air bronchogram denoting increased inflammatory process associated with decreased lung aeration and bilateral moderate pleural effusion. The patient still intubated at the end of study with failed trail of weaning. 65

1. Introduction

Ventilator-associated pneumonia (VAP) complicates the course of 8 to 28% of patients on mechanical ventilator (MV). Mortality rate for VAP ranges from 24 to 50% and may reach 76% in specific situation or when lung infection is caused by high risk pathogens. **(Chastre J and Fagon JY., 2002).**

The main pathogenic factor in VAP is the biofilm formed within the endotracheal tube (ETT). The oropharynx becomes colonized by aerobic gram negative bacteria after critical illness, antibiotic administration, hospital admission, and pooling of secretions above the ETT cuff causing VAP. The ETT prevents effective coughing so micro-aspiration of secretions occurs. The longer the duration of ventilation; the greater the risk of developing VAP. Nursing patients in supine position increases the risk of micro-aspiration and VAP development. **(P Gunasekera and A Gratrix., 2016).**

Significant proportion of patients in intensive care unit (ICU) receive antibiotics that may not be indicated, and furthermore, if antibiotics are not discontinued in light of negative cultures, a full course of unnecessary antibiotics

may be administered, which facilitate emergence of Multi Drug Resistant (MDR) organisms, which worsen the patient outcome. **(McGowan JJE., 2006).**

Of the MDR organisms, highly resistant Gram-negative bacteria (GNB) (e.g. MDR carbapenemase-producing *Klebsiella pneumonia* and *Acinetobacter spp.*) require special mention; these organisms can be resistant to all currently available antimicrobial agents or remain susceptible only to older, potentially more toxic agents such as the polymyxins, leaving limited and sub-optimal options for treatment. **(Bonomo RA and Szabo D., 2006).**

Administration of antimicrobials through aerosol allows for the depositions of antimicrobial agents directly at the site of infection, in concentrations higher than systemic administration. The adjunctive use of nebulized antimicrobial agents has been widely used in the treatment of patients with cystic fibrosis and has gained much interest in treatment of VAP, especially with the rapid emergence of MDR organisms in many ICUs. Nebulized antibiotics such as colistin have been used to successfully treat infections caused by a variety of MDR organisms such as *P.aeruginosa* or *Acinetobacter* species, resistant to most or

all available antimicrobial drugs that can be administered systemically. **(Palmer L B., 2009).**

Relapse and recurrence after initial treatment are also common, and mono-therapy with nebulized antibiotics could be an alternative treatment as it is difficult to achieve microbiological eradication for certain pathogens, including MDR organisms in VAP. **(Rangel EL et al., 2009).**

2- Aim of the work

Aim of this study is to compare efficacy of nebulized colistin versus nebulized amikacin and ceftazidime in treatment of ventilator associated pneumonia caused by Gram negative organisms.
