

**Plasma Level of Homocysteine, Folic  
Acid and Vitamin B12 Before and After  
Folic Acid Supplementation  
in Epileptic Children**

*Thesis*

Submitted for partial fulfillment of Master degree  
in Pediatrics

*By*

**Hisham Abd El Raouf Gad**

M.B.B.CH, Mansoura University  
(2002)

*Under Supervision of*

**Prof.Dr. Hamed Ahmed El-Khayat**

Professor and Head of Pediatrics Department  
Faculty of Medicine – Ain-Shams University

**Prof.Dr. Soheir Saad Korraa**

Professor of Molecular Biology  
National Centre for Radiation Research and Technology  
Egyptian Atomic Energy Authority

**Dr.Rania Hamed Shatla**

Lecturer of Pediatrics  
Faculty of Medicine – Ain Shams University

*Faculty of Medicine  
Ain Shams University*

**2014**

## Acknowledgment

*First and foremost, I fell always indebted to God, the most kind and the most merciful.*

*I would like to express my gratitude to **Prof. Dr./ Hamed Ahmed El-Khayat**, Professor and Head of Pediatrics Department, Faculty of Medicine – Ain-Shams University, for his most valuable advises and support all through the whole work and for dedicating much for his precious time to accomplish this work, I have the honor to complete this work under his supervision.*

*I am also grateful to **Prof. Dr./ Soheir Saad Korraa**, Professor of Molecular Biology, National Centre for Radiation Research and Technology, Egyptian Atomic Energy Authority, for her unique effort, considerable help, assistance and knowledge.*

*My special thanks and deep obligation to **Dr. Rania Hamed Shatla**, Lecturer of Pediatrics, Faculty of Medicine – Ain Shams University, for her continuous encouragement, supervision and kind care. Last but not least all my thanks to the infants and mothers who participated in my study wishing them all the best.*

 *Hisham Abd El Raouf Gad*

## List of Abbreviations

<b>5- HT</b>	: 5 -hydroxy tryptamine
<b>ACTH</b>	: Adreno cortico trophic hormone
<b>AICARFT</b>	: 5-amino-imidazole-4-carboxamide ribonucleotide transformylase.
<b>AICAR</b>	: 5-aminoimidazole-4-carboxamide ribonucleotide.
<b>AEDs,AED</b>	: Antiepileptic drugs
<b>ALP</b>	: Alkaline Phosphatase
<b>ALT</b>	: Alanin amino transferase
<b>AMPA</b>	: Amino- 3 hydroxy- 5 methyl- isoxasole propionoic acid
<b>AST</b>	: Aspartate aminotransferase
<b>ATPase</b>	: Energy- dependent pump
<b>B12</b>	: Vitamin b12
<b>Bid</b>	: Latin word means twice per day
<b>BPEC</b>	: Benign partial epilepsy with centrotemporal spikes
<b>Ca+2</b>	: Calcium
<b>CAE</b>	: Childhood Absence Epilepsy
<b>Cbl</b>	: Cobolamin
<b>CBS</b>	: Cystathionine <i>B</i> -synthase
<b>CBZ</b>	: Carbamazepine
<b>CL-</b>	: Chloride

<b>CPS</b>	: Complex partial seizures.
<b>CSF</b>	: Cerebrospinal fluid
<b>CT Scan</b>	: Computerized tomography
<b>CuZn-SOD</b>	: Copper-zinc superoxide-dismutase
<b>EEG</b>	: Electroencephalography
<b>EPSP</b>	: Excitatory post synaptic glutamate receptors
<b>FBP</b>	: Folate binding protein
<b>GABA</b>	: Gamma- amino- butyric acid
<b>GAD</b>	: Glutamic acid decarboxylase
<b>GART</b>	: Glycinamide ribonucleotide transformylase
<b>GGT</b>	: Gamma glutamyl transferase
<b>GPIIb/IIIa</b>	: Glycoprotein IIb/IIIa receptor
<b>GTC</b>	: Generalized tonic clonic seizures
<b>HHcy</b>	: Hyperhomocysteinemia
<b>HIF</b>	: Log intrinsic factor
<b>HIOMT</b>	: Hydroxyindole-O-methyltransferase
<b>Hr</b>	: Hour
<b>Hz</b>	: Hertz
<b>IBE</b>	: International Bureau for Epilepsy
<b>ILAE</b>	: International league against epilepsy
<b>IM</b>	: Intramuscular
<b>IPSP</b>	: Inhibitory postsynaptic potential
<b>JME</b>	: Juvenile myoclonic Epilepsy
<b>K<sup>+</sup></b>	: Potassium
<b>LEV</b>	Levetiracetam

<b>LGS</b>	: Lennox gastaut syndrome
<b>M GL u RS</b>	: Metabotropic glutamate receptors
<b>Mg<sup>2+</sup></b>	: Magnesium
<b>MIR</b>	: Magnetic Resonance Image
<b>MLT</b>	: N-acetyl-5-methoxytryptamine
<b>μmol/L</b>	: Micromole per litre
<b>Mn-SOD</b>	Maganese superoxide-dismutase
<b>MS</b>	: Methionine synthase
<b>MTS</b>	: Mesial temporal sclerosis
<b>Na<sup>+</sup></b>	: Sodium
<b>NaOH/KCN</b>	: Sodium hydroxide/potassium cyanide
<b>NAT</b>	: N-acetyltransferase
<b>No</b>	: Number
<b>NO</b>	: Nitric oxide
<b>PLP</b>	: Pyridoxal- 5- phosphate
<b>PET</b>	: Positron emission tomography
<b>PRD</b>	: Primidone
<b>Qid</b>	: Latin word means quadruple per day
<b>S</b>	Serum
<b><i>SAM(AdoMet)</i></b>	: S-adenosylhomocysteine
<b><i>SAH</i> <b>(AdoHcy)</b></b>	: S-adenosylmethionine
<b>SIADH</b>	: Syndrome of inappropriate anti-diuretic hormone
<b>SPECT</b>	: Single photon emission computerized tomography
<b>SRF</b>	: Sustained high frequency repetitive firing

<b>TCS</b>	: Tonic-clonic seizures
<b>tHcy</b>	: Total plasma homocysteine
<b>THF</b>	: Tetrahydrofolate
<b>Tid</b>	: Latin word means triple per day
<b>TS</b>	: Thymidylate synthase
<b>ttt</b>	: Treatment
<b>u</b>	: Unit
<b>VPA</b>	: Valproate
<b>VNS</b>	: Vagus nerve stimulation

# Introduction

Epilepsy, one of the oldest recorded diseases, is a chronic condition characterized by repeated spontaneous seizures. It is considered as one of the most common neurological disorders and represents a major health problem. Structural, metabolic and genetic causes of epilepsy are regularly being identified; however the majority of epilepsies are classified as having an unknown cause (*Berg et al., 2010*).

Epilepsy is considered as an important neurological disorder affecting 0.3 to 0.5% of population throughout the World causing disability and poor quality of life for patients and their caregivers (*WHO, 2008*).

An epileptic seizure can be also defined as paroxysmal, transitory disturbance of the brain function that develops suddenly, cease spontaneously and exhibits a conspicuous tendency to recur (*Frank, 2000*).

Idiopathic epilepsy is epilepsy with no clear cause (other than genetics) in individuals who are neurologically normal apart from there seizures (*Nelson, 2008*).

Infantile vitamin B12 deficiency leads to ineffective haematopoiesis and degeneration of nervous tissue (*Alamadan et al., 1993*).

So B12 deficiency may lead to many neurological manifestations as irritability, hypotonia, reflexes abnormalities (*Graham et al., 1992*).

Vitamin B12 deficiency has been encountered amongst the benign and rare causes of infantile seizures. Common symptoms of Vitamin B12 deficiency in infants include megaloblastic anemia, feeding difficulties, developmental delay, microcephaly, failure to thrive, hypotonia, lethargy, irritability, involuntary movements, seizures and cerebral atrophy (*Benbira et al., 2007*).

Many causes lead to hyperhomocysteinemia, one of these causes B12 deficiency (*Soria et al., 1990*).

Homocysteine (Hcy) is a nonessential sulfur-containing amino acid derived from methionine metabolism. The interest of the medical community in this amino acid stems from the observation that elevated plasma Hcy has been associated with cardiovascular disease in multiple large-scale epidemiologic studies and, consequently, it is considered as an independent risk factor for atherosclerosis (*Humphrey et al., 2008*).

Remethylation of homocysteine requires Vitamin B12 and methyltetrahydrofolate as coenzyme and cosubstrate (*Boddie et al., 1998*).

Homocysteine is a potential convulsant. It has been described in patients with hereditary defect of Homocysteine metabolism (homocystinuria) and has been suspected as the cause

of increased seizure frequency in these patients (*Schwaninger et al., 1999*).

The epileptic patients on chronic AED therapy are more prone than the general population to develop hyper-tHcy and low folate levels (*Tan et al., 2009*).

Hyperhomocysteinemia (Hcy) is defined by plasma Homocysteine concentration greater than 15 mmol/ L (*Robinson et al., 1996*).

Homocysteine can induce seizures in rats but the exact mechanism remains to be clarified (*Kubova et al., 1995*).

Although whether the mechanism of the AEDs induces folate depletion is not completely clear. It is suggested that there is an interference with intestinal folate absorption, enzyme activity alteration, folate depletion, and finally interference into the metabolism of the coenzyme forms of folate (*Elliott et al., 2007*).

Folic acid has been a topic of discussion within the epilepsy community for several decades. Folic acid was initially suspected to be epileptogenic (*Reynolds et al., 1973*).

Folic acid deficiency is associated with elevated levels of homocysteine, and this phenomenon appears to be prominent in those receiving enzyme-inducing AEDs (*Schwaninger et al., 1999*). Homocysteine levels are elevated both at fasting and after methionine loading in persons receiving CBZ, PHT, phenol-barbital (PB), and primidone (PRM) (*Apeland et al., 2000*).

*Belcastro et al. (2007)* used a daily folate dose of 5 mg, which was sufficient to normalize, in a population of hyper-tHcy epileptic patients, both plasma tHcy (ranging from 16.6–38  $\mu$ m) and folate levels (ranging from 3.8–7.5 nm). Given the general agreement that the bioavailability of natural food folate is incomplete, folate fortification has been adopted in the United States, and this strategy should be extended in other countries to minimize the problem. More recently, concern has been raised about possible adverse effects of excessive folate supplementation, which might be harmful in individuals at higher risk, for example, for cancer and cardiovascular disease (*Sauer et al., 2009*). Further research is needed to clarify this important aspect.
