

COMPARATIVE STUDY BETWEEN 3D ULTRASOUND AND HYSTEROSCOPY IN ASSESSMENT OF ABNORMAL UTERINE BLEEDING & PAIN ASSOCIATED WITH IUD

Thesis

Submitted in fulfillment of Master degree in
Obstetrics & Gynecology

By

Mohamed Mahmoud Hegazy

(M.B , B.Ch.)

**MISR UNIVERSITY FOR SCIENCE & TECHNOLOGY,
2004**

Supervised by

Prof. Rawia Ahmed Ezzat

*Professor of Obstetrics and Gynecology
Faculty of Medicine –Cairo University*

Prof. Osama Ahmed Shawki

*Professor of Obstetrics and Gynecology
Faculty of Medicine –Cairo University*

Prof. Mona Mohamed Abou Alghar

*Assistant Professor of Obstetrics and Gynecology

بِسْمِ اللَّهِ الرَّحْمَنِ الرَّحِيمِ

ACKNOWLEDGMENT

First and for most I feel always indebted to Allah, the most kind and most merciful

*I would like to express my sincere thanks and appreciation to my supervisor **Prof. Rawia Ahmed Ezzat** Professor of Obstetrics and Gynecology, Faculty of Medicine, Cairo University, for her continuous meticulous supervision and fruitful guidance. She gave me much of her time and effort which have made it a rewarding experience.*

*I am especially indebted to **Prof Dr. Osama Ahmed Shawki** Professor of Obstetrics and Gynecology, Faculty of Medicine, Cairo University, for his close supervision and encouragement to complete this study which made it a rewarding experience. He gave me much time and taught me a lot about hysteroscopy.*

*I would like to express my sincere thanks and appreciation to my supervisor **Dr. Mona Abou Mohamed Alghar** Assistant Professor of Obstetrics and Gynecology, Faculty of Medicine, Cairo University, for her continuous meticulous supervision and fruitful guidance. she gave me much time and effort, taught me a lot about ultrasound which made it a rewarding experience.*

*I would like to express my sincere thanks and appreciation to **Dr. Waleed Saber** lecturer of Obstetrics and Gynecology, Faculty of Medicine, Cairo University, for his, effort in performing most of the office hysteroscopy of this research and for his unlimited help to complete this study.*

12	Shows some pathological findings in patients with IUCD	61

ABSTRACT

According to the results of this study. It was found that the majority of cases complaining of pain & bleeding with IUD have well placed IUD thus there is no doubt that the cause of bleeding in IUD users in those cases do not correlate with the position of the IUD. IUCD presence, per say, regardless its position in the uterine cavity can cause menorrhagia. **3D** coronal view of the uterus may be an important part of the gynecological ultrasound examination in any patient with an IUCD. Producing a coronal view of the IUCD that show the entire device and its position within the uterus may help to explain pelvic pain and bleeding in patients with malpositioned IUCDs. Also it allows better reliability in detecting abnormalities in endometrial cavity such as polyps, submucous myomas, adenomyosis & any adenexial masses such as ovarian cysts. which was found to be the cause of bleeding & pain with IUCD in many cases. 3D U/S can guide the patient & the gynecologist to do other procedures specially in cases of Persistent bleeding & pain with IUCD and the 3D U/S was normal or showing a focal lesion in the endometrial cavity. Hysteroscope act as a complementary method to 3D U/S in absence of any other causes of abnormal uterine bleeding & pain with IUCD diagnosed by 3D U/S. However, since the sample number is small, it might be difficult to confirm these results and give recommendations upon them. It is also proposed that further research would be done on this topic to confirm or negate these results.

Uterine bleeding
Pain associated with IUD

INTRODUCTION

INTRODUCTION

The first use of the intrauterine contraceptive device (IUCD) was assigned to caravan drivers who used the intrauterine stones to prevent pregnancies in their camels during long journeys (*Speroff, 2005*). IUCD is the most widely used contraceptive method in the world. In 1995, it was reported that IUCDs were used by over than 100 million women all over the world, and is considered the second reliable method of contraception after oral hormonal contraceptives (*O'Brien et al., 2008*). Prevalence rates range among different countries is from 2 to 80% of contraceptive users (*ESHRE Capri, 2009*).

Excessive bleeding is the main presenting complaint in women referred to gynecologists and between 5 to 15% of women will have their IUCDs removed because of bleeding (*Speroff, 2005*).

Transvaginal ultrasound (TVS) is the imaging technique of choice as a first line investigation of endometrial abnormalities being a possible cause of abnormal uterine bleeding (*Leone et al., 2007*).

Imaging: Specifically sonography has a crucial role in the evaluation and management of IUCDs and associated complications, including dislocation to low position, associated infection, myometrial migration, uterine perforation, intrauterine or extrauterine pregnancy associated with the IUCD and retention and fragmentation of the IUCD (*Peri et al., 2007*). IT has been reported that the position of the IUCD is related to the occurrence of bleeding and pain, by using transvaginal ultrasound (TVS) it has been possible to identify the

distance between the upper end of the IUCD and the uterine fundus (*Kuwata et al., 2005*).

Three-dimensional (3D) ultrasound in gynecology is a new imaging modality which is being introduced in clinical practice. Although this technique is unlikely to replace the two-dimensional (2D) ultrasound, it is being increasingly used since it has been reported that 3D ultrasound is a high reproducible technique which has many applications in the field of gynecology (*Valsky et al., 2006*).

3D ultrasound provides useful information on the location of the IUCD following insertion. It enables imaging of the entire IUCD, i.e. the shaft and the arms, simultaneously (*Lee et al., 1997*).

Hysteroscopy permits direct visualization of cervical canal and uterine cavity. Diagnostic hysteroscopy is accurate in diagnosis of intra uterine abnormalities. As diagnostic hysteroscopy is predominantly performed in the out patient clinic, thereby an accurate diagnosis can be reached in the same setting which is important to direct treatment of any specific pathology and avoid needless surgery. More over, it may contribute to prognosis of expected quality of life (*Van Dangen et al., 2007*).

Persistent IUCD induced bleeding requires definitive diagnosis and treatment. Removal of the device, sometimes, is not the proper approach. It is of great value to perform hysteroscopy for IUCD users with bleeding to evaluate the IUCD fitting in the uterine cavity and to

detect any displacement whether downwards or lateral. Hysteroscopy is also beneficial for proper screening of the cervical canal, endometrial surface and the uterine cavity for visible pathology and/or anomaly. Uterine curettage should be done, preferably after removal of the device, in cases with persistent and/or excessive IUCD induced bleeding for accurate pathological diagnosis (*Aboul Nasr et al., 1996*).

AIM OF THE WORK

AIM OF THE WORK

The aim of the present work is to compare between three dimensional ultrasound (3D U/S) and hysteroscopy in assessment of pain and irregular uterine bleeding in IUCD users, and to assess the efficacy of these methods in detecting possible endometrial and IUCD abnormalities.
