Department of Anesthesia & Intensive care

Anesthetic Management for Nasal Surgery

An Essay Submitted For Partial Fulfillment of Master Degree in Anesthesiology

BY

Ahmed Ali Abd Elsalam Hemida

(M.B.B.CH)

Supervised by

Prof Dr. Mahmoud Sherif Mostafa

Professor of Anesthesiology and Intensive care

Faculty of Medicine-Ain Shams University

Dr. Hadeel Magdy Abd Elhameed

Lecturer of Anesthesiology and Intensive care

Faculty of Medicine-Ain Shams University

Dr. Ahmed Mohamed Elhenawy

Lecturer of Anesthesiology and Intensive care

Faculty of Medicine-Ain Shams University

2010

Acknowledgment

*Thanks for **Allah** at first, At last and forever. Thanks for what Allah gave and prohibited.*

*It is a pleasure to me to express my deepest gratitude to **Prof. Dr. Mahmoud Sherif Mostafa**, Professor of Anesthesiology and Intensive care, faculty of Medicine; Ain Shams University Who gave me much of his time & experience and very kindly guiding me in this work,*

*Also, I'm deeply indebted and grateful to **Dr. Hadeel Magdy Abd Elhameed**, Lecturer of Anesthesiology and Intensive care , faculty of Medicine, Ain Shams University and **Dr. Ahmed Mohamed Elhenawy** , Lecturer of Anesthesiology and Intensive care, faculty of Medicine, Ain Shams University For their great help & Kind supervision.*

Ahmed Ali Abd El Salam

Acknowledgement

It is a great thing to achieve all what is always aspired. Nevertheless, one must not forget all those who usually help and push him to the most righteous way that inevitably ends with fulfillment and perfection.

*When the instant comes to appreciate all those kind-hearted people, I soon mention **Dr. Maiy Hamdy Elsayed**, professor of cardiology, Ain Shams University, the person who really helped me by her precious opinions and contributive comments that served much in the construction of this work.*

*Great thanks are also to **Dr. Azza Abdallah Elfiky**, professor of cardiology, Ain Shams University. She was always there to care, support, encourage and provide constructive pieces of advice in every possible way.*

*Thanks also to **Dr. Ghada ElShahid**, assistant professor of cardiology, Ain Shams University, who was been the real sister, whom fruitful thinking and encouraging was behind the progress of this work.*

*I am also very grateful to **Dr. Mohamed Ismail**, lecturer of cardiology, Ain Shams university for his help and support throughout this work.*

*I would like to thank **Dr. Alaa Roshdy**, lecturer of cardiology Ain Shams University and **Dr. Essam Baligh**, assistant professor of cardiology Cairo University for their encouragement and guidance throughout this work.*

I cannot forget the help of the medical staff and nursing team in our Cardiology department and pediatric care unit for their cooperation in the practical part of this work.

*I would also like to record my thanks and sincere gratitude to **my parents and wife** for their great help and support.*

Walid Ahmed Emam

INTRODUCTION

Airway problems are the major concern in nose surgery, related both to the underlying clinical problem and the shared air way (*Keith and Lain, 2008*).

General anesthesia is often preferred for nasal surgery because of the discomfort and incomplete block that may accompany topical anesthesia. Special consideration during induction include using an oral airway during face mask ventilation to mitigate the effects of nasal obstruction, intubation with a reinforced or preformed right-angle endotracheal tube , and tucking the patient's padded arms to the side (*Morgan et al., 2006*).

Regardless of the anesthetic technique selected for nasal surgery (general anesthesia or conscious sedation), it is likely that local vasoconstriction (topical local anesthetic, cocaine and epinephrine) will be used. A moderate degree of controlled hypotension combined with head elevation to decrease bleeding at surgical site (*Paul et al., 2009*).

The surgeon and anesthesiologist should plan together to use techniques/ equipment that provide good conditions for surgery whilst maintaining a safe secure air way, regarding other structures around the head which are inaccessible during surgery and need protection-especially the eyes (***Keith and Lain, 2008***).

Anatomy of the Nose

Nose is the first part of the upper respiratory tract and consists of paired nasal cavities divided from each other sagittally by the nasal septum and housed in a bony and cartilaginous framework that extends anteriorly as the external nose (*Fig.1*). The two halves of the nasal cavity open onto the face through the nares, and are continuous posteriorly with the nasopharynx through the posterior nasal apertures or choanae. The cavity is divisible into three regions, the nasal vestibule anteriorly, the chemosensory olfactory area posterosuperiorly and the respiratory region between them which constitutes the majority of the nasal cavity. The anterior nasal vestibule narrows posteriorly to form the nasal valve (the narrowest portion of the nasal airway). A series of air-filled expansions, the paranasal sinuses, lie within either the lateral walls of the nasal cavities, or in communication with them in adjacent bones (*Barry, 2005*).
