

# **MANAGEMENT OF SEXUAL DEVELOPMENTAL DISORDERS**

An Essay For Partial Fulfillment For Master Degree  
In General Surgery

*By*

**Khaled Mohammed Sayed Ismail**  
M.B.B.Ch. – Assiut University.

*Supervisors*

**Prof. Dr. AHMED ABD EL-AZIZ ABD EL-GHAFAR**

Prof. of General Surgery  
Faculty of medicine, Al-Azhar University

**Prof. Dr. TAREK MAHMOUD YOUSEF EL-BANOBY**

Assistant Prof. of Plastic Surgery  
Faculty of medicine, Al-Azhar University

**Dr. YASSER HELMY ISMAIL ALY**

Lecturer of Plastic Surgery  
Faculty of medicine, Al-Azhar University

Faculty of medicine  
Al-Azhar University

2013 (A .D.)-1434 (H.)

## DEDICATION

To the soul of my beloved "father" "*may Allah have mercy upon him*".

To my family who shared my ups and downs.

To my kids "Jodie and Mohammed".

And to all of those who care for spreading knowledge, whoever and wherever they are.

## LIST OF ABBREVEATIONS

(HHA) axis	Hypothalamic–hypophyseal– adrenal
11OHD	11 $\beta$ -hydroxylasedeficiency
17OHP	17-hydroxyprogesterone
17 $\beta$ -HSD-3	17 $\beta$ -hydroxysteroid dehydrogenase type III deficiency
21-OHD	Steroid 21-hydroxylase deficiency
3 $\beta$ HSD	3 $\beta$ hydroxysteroid dehydrogenase deficiency
5 $\alpha$ -RD-2	5 $\alpha$ - Reductase type 2
A.D.	Anno domini (Latin: years after Christ was born)
ACTH	Adrenocorticotrophic hormone
AIS	Androgen insensitivity syndrome
AMH	Anti Mullerian Hormone
AR	Androgen receptor
ATRX	Alpha thalassimia , mental retardation syndrome. X-Linked gene
B.C.	Before Christ
BI	Behavioral identity
CAH	Congenital adrenal hyperplasia
CAIS	Complete androgen insensitivity syndrome
CGH	Comparative genomic hybridization
CGH	Comparative genomic hybridization
CVS	Chorionic villus sampling
DHEA	Dehydroepiandrosterone
DHEAS	Dehydroepiandrosterone Sulphate
DHT	Dihydrotestosterone
dpc	Days post conception
DSD	Disorders of sex development
DSM-IV-TR	Diagnostic and Statistical Manual of Mental Disorders, fourth, edition, text revision
ESC	Embryonic stem cells
ESPE	European Society for pediatric Endocrinology
FISH	Fluorescence in-situ hybridization
FSH	Follicle stimulating hormone
GID	Gender identity disorder
GSCs	Germline stem cells
HCG	Human chorionic gonadotropin
hESCs	Human embryonic stem cells
HRT	Hormone replacement therapy
ICD-10	International Classification of Diseases, 10th ed.

II	Individual identity
INSL3	Insulin-Like factor 3
iPSCs	Induce pluripotent stem cells
LC	Liquid chromatography
LH	Luteinising hormone
LHR	Luteinising hormone receptor
LWPES	Lawson Wilkins Pediatric Endocrine Society
MAGPI	Meatal advancement and glanduloplasty
MAIS	Minimal or mild androgen insensitivity syndrome
MGD	Mixed gonadal dysgenesis
MS/MS	Tandem mass spectrometry
NCAH	Nonclassical congenital adrenal hyperplasia
ODSD	Ovotesticular DSD
PAIS	Partial androgen insensitivity syndrome
PAP	Pyrophosphorolysis –activated polymerization
PGCs	Primordial germ cells
PMDS	Persistent Mullerian duct syndrome
PORD	P450-oxidoreductase deficiency
PUH	Peace upon him
PUM	Partial urogenital sinus mobilization
QF-PCR	Quantitative fluorescent polymerase chain reaction
RBV	Retropubic balloon vaginoplasty
SF-1	steroidogenic factor-1
SHBG	Sex hormone binding globulin
SI	Social identity
SLOS	Smith–Lemli–Opitz syndrome
SRY	Sex determining region on the Y chromosome
SSC	Spermatogonial stem cells
SV	Simple virilizing
SW	Salt-wasting
T	Testosterone
TPIF	Transverse preputial island flap
TRS	Testicular regression syndrome
TUM	Total urogenital sinus mobilization
UDT	Undescended testis
UGS	Urogenital sinus
US	Ultrasonography
WT1	Wilms’ tumor-associated gene-1

## LIST OF FIGURES

FIG. 1	Facsimile painting of a stone relief carving , depicting a circumcision from the Mastaba of Ankh-ma-Hor, “The Doctors Tomb” in Saqqara, Egypt .	Page 5
FIG. 2	A midwife operating on a hermaphrodite, by Charaf-ed-Din (1404–1468) .	7
FIG. 3	The repair of urethral fistulae was the only reconstructive surgery attempted in the nineteenth century.	8
FIG. 4	(A) Schematic representation illustrating the relative expression of gene products involved in sexual differentiation of the gonad. (B) Model depicting our results and the predicted effects on gene expression in the developing male gonad.	11
FIG. 5	Regulation of germ cell migration .	12
FIG. 6	Mapping of genes involved in sex determination and differentiation (in blue) residing on sex chromosomes.	13
FIG. 7	A model for the regulatory network of proteins involved in gonadogenesis.	15
FIG. 8	Undifferentiated reproductive tract. Both Wolffian and Müllerian ducts are present.	17
FIG. 9	Development of the external genitalia (a) in the male ;(b) in the female.	19
FIG. 10	Testis and epididymis.	20
FIG. 11	Vertical section through the testis and epididymis, showing the arrangement of the ducts of the testis and the mode of formation of the vas deferens	21
FIG. 12	Structural features of a testis within the scrotum. (a) a longitudinal view and (b) a transverse view.	22
FIG. 13	Ventral aspect of the constituent erectile masses of the penis in erect position.	23
FIG. 14	Transverse section of penis.	24
FIG. 15	The uterus, fallopian tube and the left broad ligament, show the distribution of the left uterine and ovarian arteries.	25
FIG.16	Uterus and layers of the uterine wall.	26
FIG. 17	The external female genitalia.	27
FIG. 18	Gonadal and adrenal steroidogenesis.	36
FIG. 19	The alternate or “backdoor” pathway to DHT.	37

FIG. 20	Scheme of the biosynthesis of cortisol. In the case of 21-hydroxylase deficiency .	38
FIG. 21	Spectrum of the clinical forms of 21-OHD.	39
FIG. 22	Steroidogenesis. Mutation of CYP11B1 causes reduced 11 $\beta$ -hydroxylase activity and results in increased levels of precursors.	41
FIG. 23	Altered steroidbiosynthesis in3 $\beta$ hydroxysteroiddehydrogenase deficiency .	42
FIG. 24	Altered steroid biosynthesis in P450-oxidoreductase deficiency .	43
FIG. 25	Twenty-seven years old male with XX-syndrome	45
Fig. 26	Patient with Lydig cell hypoplasia caused by LH receptor mutation	49
FIG. 27	Schematic representation of the first step of steroidogenesis.	50
FIG. 28	The adrenals and the urogenital tract of a 46,XY individual with congenital lipoid adrenal hyperplasia.	51
FIG.29	Cartoon of human foetal Leydig cell showing all steps involved in androgen production .	51
FIG. 30	Patient with 46,XY DSD caused by a 17 $\beta$ -hydroxysteroid dehydrogenase defect in testosterone biosynthesis	52
FIG. 31	Scheme of the genomic action of the AR .	53
FIG. 32	Genetics of androgen receptor : Domains of the AR.	54
FIG. 33	A 23 years old patient with CAIS.	55
FIG. 34	Thirty years old man with Klinefelter syndrome.	58
FIG. 35	Patient with Turner syndrome.	59
FIG. 36	Prader scale reflecting the degree of virilization of the external genitalia .	67
FIG. 37	Anatomical diagram of cross-section of clitoral shaft.	101
FIG. 38	Anatomical drawing of clitoroplasty.	102
FIG. 39	McIndoe vaginoplasty	103
FIG. 40	The silicone-coated vaginal stent .	104
FIG. 41	Amnion vaginoplasty.	105
FIG. 42	Davydove technique (Peritoneal Flap) vaginoplasty .	107
FIG. 43	Laparoscopic Vecchietti technique .	108
FIG.44	Position of the traction device in the Vecchietti procedure.	109
FIG. 45	Retropubic balloon vaginoplasty (RBV) .	110
FIG. 46	Transverse Retubularized Ileal Vaginoplasty.	111
FIG. 47	Vaginal dilators .	112

FIG. 48	Vaginoplasty with bilateral islanded pudendal thigh flaps	114
FIG. 49	Vascular basis of horse-shoe labia minora flap.	115
FIG. 50	Horse shoe flap vaginoplasty .	116
FIG. 51	High confluence and low confluence UGS .	118
FIG. 52	Perineoplasty in CAH .	119
FIG. 53	Mathieu procedure for hypospadias repair.	122
FIG. 54	Tubularized incised plate urethroplasty.	123
FIG. 55	Midline relaxing incision of the urethral plate in Snodgrass repair.	123
FIG. 56	MAGPI (Duckett series) .	124
FIG. 57	Steps of transverse preputial island pedicle flap (TPIF).	125
FIG. 58	Onlay island flap repair.	125
FIG. 59	Phalloplasty using abdominal skin flap (De Castro Technique).	127
FIG. 60	Design of extended pedicle groin flap .	128
FIG. 61	Tabularization of the extended pedicle groin flap to form neourethra .	129
FIG. 62	Extended pedicle groin flap is elevation.	129
FIG. 63	The RFF planned on the volar surface of the left forearm.	130
FIG. 64	The ulnar part of the RFF flap is rolled around , forming the neourethra.	131
FIG. 65	The radial part of the RFF flap is rolled around the neo-urethra with the skin surface facing outwards.	131
FIG. 66	Postoperative X-ray on donor site of Radial forearm osteocutaneous free flaps.	132
FIG. 67	Free osteofasciocutaneous fibular flap phalloplasty.	132, 133
FIG. 68	Pedicled anterolateral thigh flap.	135
FIG. 69,70	Musculocutaneous latissimus dorsi free flap phalloplasty .	136

## LIST OF TABLES

Table 4	Classification of the androgen insensitivity syndrome.	56
Table 5	46,XX DSD conditions and Diagnostic serum steroids.	70
Table 6	Summarey of Investigations in DSD.	73
Table 7	Intramuscular hydrocortisone doses for emergency use.	87

# ACKNOWLEDGMENT

First and foremost thanks to **Allah** , the most beneficial , the most kind and the most merciful.

Words are not enough to express my deepest thanks to **Prof. Dr . Ahmed Abd El-Aziz Abd El-Ghafar** , Prof. of General Surgery, Al-Azhar University for his continuous support , encouragement and generous advise whenever needed during preparation of this study.

I also wish to extend my deepest gratitude to **Prof. Dr. Tarek Mahmoud Yousef El-Banoby** , Assistant Prof. of Plastic Surgery, Al-Azhar University . For his kind support , continuous encouragement , unlimited help and valuable advice that guided me to accomplish this work .

My deepest gratitude goes to **Dr. Yasser Helmy Ismail Aly** , Lecturer of Plastic Surgery , Al-Azhar University . He freely gave me his time , effort and experience along with continuous guidance , constructive criticism and unlimited support.

Thanks to all staff members of ***Plastic and Reconstructive Surgery Department Faculty of Medicine Al-Azhar Univesity*** .

Finally I am grateful to everyone who extended his or her hand to help me .

*Khaled Mohammed Sayed*

## INTRODUCTION

The German pathologist Theodore Klebs who recognized at autopsy that it was possible for the external genitalia to be discordant with the gonads. Those in whom he found normal ovaries but virilized external genitalia he called, in English translation, female pseudohermaphrodites, whereas those with normal appearing testes but undervirilized genitalia he called male pseudohermaphrodites. In contrast to those, he recognized certain individuals who harbored both an ovary and a testis, which he called true hermaphrodites (*Aaronson and Aaronson, 2010*).

Advances in identification of molecular genetics causes of abnormal sex with heightened awareness of ethical issues and patient advocacy concerns necessitate a re-examination of nomenclature (*Hughes et al., 2006*).

Terms such as Intersex, pseudohermaphrodites, hermaphrodites, sex reversal are particularly controversial. These terms are perceived as potentially projective by patients and can be confusing to both practitioners and parents (*Hughes et al., 2006*).

Consequently, the recommended nomenclature to replace intersex is the umbrella terminology "disorders of sex development" (DSD). This is defined as congenital condition in which development of chromosomal, gonadal, or anatomical sex is atypical. However, the nomenclature has no diagnostic purpose other than as a starting point towards the goal. The inclusion of the term congenital within the definition excludes all the condition listed as causes of precocious or delayed puberty. The abbreviation (DSD) is not in common usage for any other "competing" medical disorder (*Hughes, 2008*).

There are numerous models of classification to bewilder the reader with the lists of all possible cause of DSD. **No system is perfect**, one of the categories is 'sex chromosome anomalies' as these remain a major component of the causes of DSD. The other two categories are the XX, DSD and XY, DSD and are both subdivided according to a primary disorder of gonad development versus a disorder of sex steroid biosynthesis arising from an otherwise more physiologically normal gonad (*Hughes, 2008*).

Optimal care for children with DSD requires an experienced multidisciplinary team that is generally found in tertiary care centers.

Ideally the team includes specialties in endocrinology, surgery and / or urology, psychology / psychiatry, gynaecology, genetics, neonatology, social work, nursing and medical ethics (*Hughes et al., 2006*).

Hypogonadism is common in patients with dysgenetic gonads, defect in sex steroid biosynthesis and resistance to androgens. Hormonal induction of puberty should attempt to replicate normal pubertal maturation, to induce secondary sexual characteristics, a pubertal growth spurt and optimal bone mineral accumulation using testosterone esters. Females with hypogonadism require oestrogen supplementation to induce pubertal changes and menses (*Hughes et al., 2006*).

The genital surgery began since ancient man's first attempts of performing surgery. Trepanation, amputation, incision and circumcision were historical crude attempts at surgery. The bold and imaginative innovations of French, German, English, and American surgeons of the early nineteenth century rescued surgery from the lack of knowledge of previous centuries and charted the way for succession of rapid development (*Rogers, 1973*).

Surgeons such as Cooper, Warren, Dupuytren, Dieffenbach, and Mattauer were responsible for a host of new surgical ideas and development of technical tips which in the latter half of the nineteenth century, provided plastic surgery and urological surgery in particular with a new era supply of surgical improvement (*Rugie and Sykes, 2007*).

A few years ago it was said that gender assignment could be delayed until later childhood when the child express more clearly his or her individual identity this attitude has a lot of controversies, and it is currently accepted by most practitioners that: the assignment should be done early in life to avoid difficult situations for the parents and the child (*Vidal et al., 2010*).

However, (Money and Hampson, 1957) their findings, suggested that most infants are able to discriminate between the sexes by the end of their first year. At two to three years of age, children are able to label themselves correctly and by three, preference for a gender role emerges. With the onset of the fifth year, they begin to have a sense of gender constancy (Ruble and Martin, 1998). Other factors favouring early intervention are: the threat of cancer in women with XY material in gonads that have not been removed, the great ease with which the surgery can be conducted on children and the finding that the majority of patients

who have had early surgery to relieve their emotional distress are content with their assigned gender as adults (*Rebello et al., 2008*).

The surgical options for virilized female (46, XX) encompasses three main steps: vaginoplasty, the clitoral plasty and the perineoplasty. The surgical options in undervirilised male (46, XY) aims at repairing a hypospadiac penis, phalloplasty, glanuloplasty and testicular surgery. Or up to total genital reconstruction in both sex (*Vidal et al., 2010*).

## **AIM OF THE WORK**

*To review different modalities in management  
of Sexual Developmental Disorders.*
