

**The effect of in vivo mobilization of bone marrow
stem cells on the pancreas of diabetic albino rats
(A histological & immunohistochemical study)**

Thesis

*Submitted for Fulfillment of the
M.Sc. Degree in Histology*

By

Alshaymaa Gamal Abolkhair

*Demonstrator of Histology
Faculty of Medicine
Cairo University*

Supervised by

Prof. Dr. Zeinab Mohamed Kamel Ismail

*Professor of Histology
Faculty of Medicine
Cairo University*

Dr. Ashraf Mahmoud Fawzy Kamel

*Assistant Professor of Histology
Faculty of Medicine
Cairo University*

Dr. Mira Farouk Youssef Yacoub

2011**

Acknowledgement

*I would like to express my sincere gratitude and deep appreciation to **Prof. Dr. Zeinab Mohamed Kamel Ismail**, Professor of Histology, Faculty of Medicine, Cairo University who suggested the topic of this study and supplied me with StemEnhance drug. She has been with me in every step of this work. I deeply appreciate her patience and repeated and faithful supervision of every item of this work. She did not save any effort in teaching me how to present a respectable thesis. Her generosity meant much to me. She also allowed me to express my opinion freely and considered it. To work under her supervision has been a great honor.*

*There is no word capable of expressing my everlasting gratitude to **Dr. Ashraf Mahmoud Fawzy Kamel**, Assist. Professor of Histology, Faculty of Medicine, Cairo University. He did not save any effort in teaching me the art of photographing, image analysis, representation of morphometric graphs and the basis of statistics. I shall never forget his assistance and his patience in revision of this work word by word.*

*I wish to express my grateful thanks and deep appreciation to **Dr. Mira Farouk Youssef Yacoub**, Assist. Professor of Histology, Faculty of Medicine, Cairo University, for her valuable advice, friendly attitude and faithful revision of this work. She paved me the way for photographing, using the image analyzer & interpretation of the results.*

*It gives me a pleasure to record my gratefulness and appreciation to all my friends in Histology Department, Faculty of medicine, Cairo University especially **Dr. Marwa M Yousry and Dr. Eman Abbas**, for their valuable advice and giving me all the help to accomplish this work.*

*Special thanks for my sister **Dr. Fatma Elzahraa Gamal**, for her help and encouragement.*

*It is a great pleasure to remember the great help and cooperation of the staff members (**Doctors, Technicians and Workers**) in the Histology Department, Faculty of medicine, Cairo University for their help whenever needed.*

Lastly, my thanks are sent to every kind hand that was extended to help me to accomplish this work.

Alshaymaa Gamal

***THE PRAYFUL THANKS TO OUR
MERCIFUL ALLAH, WHO GIVES ME
EVERYTHING I HAVE***

DEDICATED TO:
MY MOTHER Dr. FARIDA H. AHMED
AND MY FAMILY

ABSTRACT

The rapidly increasing number of diabetic patients across the world drew the attention to develop more effective therapeutic approaches. Recent investigations on newly differentiated insulin producing cells (IPCs) revealed that they could be derived from embryonic, adult mesenchymal and hematopoietic stem cells. This work was planned to evaluate the role of StemEnhance in mobilizing naturally occurring bone marrow stem cells in addition to the effect of this mobilization in improving streptozotocin-induced diabetes mellitus in rats.

Forty four adult male albino rats were included in this study. They were divided into four groups namely the control, the diabetic, the positive control-StemEnhance and the diabetic-StemEnhance groups. The mean number of CD34 immunopositive cells was measured by flowcytometry and random blood sugar was measured weekly. The pancreas was removed from the sacrificed rats and processed for staining with H&E and immunohistochemical staining for CD34 +ve and insulin +ve cells. Data obtained by morphometric study were discussed in relation to the findings detected by microscope.

CD34+ve cells increased in the blood after introduction of StemEnhance. CD34 +ve cells were observed in the pancreas throughout the four weeks of treatment and the insulin producing cells in the islets of Langerhans gradually increased from the first to the fourth week of treatment. Blood glucose level decreased but it was still higher than the control level after four weeks of treatment with StemEnhance.

KEY WORDS: Diabetes, Stem cells, CD34, StemEnhance, Streptozotocin, Pancreas.

LIST OF ABBREVIATIONS

Abbreviations	Words
AFA	Aphanizomenon flos-aquae
AMD3100	Plerixafor or 1,1'-[1,4 Phenylenebis(methylene)]bis [1,4,8,11-tetraazacyclotetradecane]
ASCs	Adult stem cells
B.M	Bone marrow
BMC	Bone Marrow Cell
BSA	Bovine serum albumin
CD	cluster of differentiation
CFU	Colony forming unit
CFU-F	Fibroblast Colony forming unit
CK	Cytokeratin
CXCR4	Chemokine receptor 4
D.M	Diabetes Mellitus
EPCs	Endothelial precursor cells
ESCs	Embryonic stem cells
FACS	Fluorescence-Activated Cell Sorting
G-CSF	Granulocyte-colony stimulating factor
GIT	Gastrointestinal tract
GLUT	Glucose transporter
GM-CSF	Granulocyte-monocyte colony stimulating factor
HSCs	Hematopoietic stem cells
I.P	Intraperitoneal
ICM	inner cell mass
ihcworld	immunohistochemistry world
IL	Interleukin
IPCs	insulin-producing cells
LFA-1	Lymphocyte function-associated antigen 1
LSL	L-selectin ligand

Abbreviations	Words
MSCs	Mesenchymal stem cells
NAD	Nicotinamide dinucleotide
PARP	Poly (ADP-ribose) polymerase
PBS	Phosphate buffered saline
rhIL	Recombinant human interleukin
ROS	Reactive oxygen species
SCF	Stem cell factor
SDF-1α (CXCL12)	Stromal cell- derived factor-1 α
SE	StemEnhance
STZ	Streptozotocin
TE	Trophectoderm
vWF	vonWillebrand factor
+ve	Positive

Introduction

Introduction and Aim of the Work

Introduction:

Diabetes mellitus is a major health problem affecting more than 200 million of adult populations worldwide and is expected to affect at least 5 % of global population by the year 2025. The association of diabetes with micro and macrovascular complications as well as cardiomyopathy makes it a major cause of morbidity and mortality in the world (**Wild et al., 2004; Joshua et al., 2005**).

Diabetes mellitus has two forms: Type I (insulin-dependent) caused by an autoimmune destruction of the insulin-producing β -cells. Type II (noninsulin-dependent), results from a combination of reduced insulin sensitivity of tissues and impaired function of the insulin-secreting β -cells (**DeFronzo et al., 2004**).

Treatments of diabetes by different regimens of insulin injections failed to offer complete cure and could not prevent secondary complications associated with diabetes, such as diabetic retinopathy, nephropathy and neuropathy. Moreover, insulin therapy was frequently associated with severe hypoglycemic episodes (**Mandrup-Poulsen., 1998; Vija et al., 2009**).

Early treatment of patients by restoration of their β -cell function through pancreas or islet transplantation can relieve the patients from their dependency on insulin, achieve lifelong normoglycemia and prevent related complications (**Juang et al., 1996; Weir and Bonner-Weir., 1998; Shapiro et al., 2000; Robertson et al., 2004**)
