ACKNOWLEDGEMENTS

The authoress wishes to express her deepest appreciation and gratitude to Prof. Dr. **Raifa Ahmed Hassanein**, Professor of Plant Physiology and Dr. **Hemmat Khattab Ibrahim Khattab**, Associate Professor of Plant Physiology, Department of Botany, Faculty of Science, Ain Shams University for their guidance throughout this work.

The authoress offers her thanks and gratitude to Prof. Dr. **Hisham Afify Mohamed Mostafa**, Professor of Plant Physiology and Dr. **Hala Mohamed Safwat El-Bassiouny**, Associate Professor of Plant Physiology, Botany Department, National Research Centre for their continuous supervision and fruitful assistance throughout this work.

My thanks and gratitude to Prof. Dr. **Raifa Ahmed Hassanein** Head of Botany Department, and all the staff members of Department of Botany, Faculty of Science, Ain Shams University.

Grateful thanks are also extended to all the staff members of Botany Department, National Research Centre, Dokki, Giza. For their kind encouragement and help during this work.

Abstract

Mervat Shamoon Sadak (Physiological studies on the interaction effects of Gibberellic acid and Benzyladenine on roselle (*Hibiscus sabdariffa* L.) plant. Doctor Philosophy Degree of Science, Botany Department. Faculty of Science, Ain Shams University. 2005.

The effect of foliar spray with GA₃ and / or BA in absence and presence of Fe–EDTA on the growth and yield components of roselle plants (*Hibiscus sabdariffa* L) were investigated. The changes induced by the same treatments on the different types of the endogenous phytohormones, photosynthetic pigments, carbohydrates, nitrogenous constituents, nucleic acid contents, activities of phenylalanine ammonia lyase (PAL) and tyrosine ammonia lyase (TAL), total phenols, titratable acidity and organic acids content and element composition of treated plants were also studied. GA₃ and / or BA significantly increased all growth parameters throughout the experimental period and yield components expressed as number of fruits per plant and their weights, fresh and dry weights of sepals per plant and dry weight of seeds per plant above those of the untreated control. Anthocyanin contents, soluble sugars, K, Mg, Ca, P and Fe ion contents of sugars increased in response to GA₃ and/or BA treatments while Na ion content, titratable acidity decreased. The most suitable harvest age for roselle sepals is at 50 – 60 days after the beginning of flowering, where the highest amount of anthocyanins and acid contents which declined if being left later.

The most effective treatment in inducing the highest seed, sepal yield and anthocyanin contents of sepals is the mixture of 100 mg / L of both GA₃ and BA in presence of Fe–EDTA.

Total soluble sugars, protein–N and oil contents of the harvest seeds of differently treated roselle plants increased, while soluble–N content decreased. Roselle seeds are provided as a new source of edible oil, since the fatty acid composition of their oil was found to be closely similar to that of corn oil.

GA₃ and / or BA treatments improved fibre yield and fibre properties in terms of length, tensile strength and diameter. Also, the same treatments increased cellulose and decreased lignin contents of fibres and consequently increased the cellulose/lignin ratio. Cellulose is known to increase the strength of plant fibres to approach that of steel.

The different treatments applied were shown to increase the endogenous phytohormones which are responsible for the increase in growth and yield components of roselle plant on one hand and the regulation of metabolic activity on the other hand.

Key words: Roselle – *Hibiscus sabdariffa* L. – GA₃ – BA – Fe–EDTA
Anthocyanin – oil – fibre – endogenous phytohormones
- mineral ions – nucleic acids.

11-Fibre analysis -----	46
12-Determination of certain elements -----	48

EXPERIMENTAL RESULTS

The effect of GA₃, BA or both in absence and presence of Fe-EDTA on growth, productivity, growth substances and metabolism of roselle plants.

1 – Growth Responses -----	51
2 – Effect of GA ₃ and / or BA in absence and presence of Fe-EDTA on total anthocyanins and acidity of roselle sepals during flower development	
2 – a Total anthocyanins -----	81
2 – b Titratable acidity -----	84
2 – c Citric acid and oxalic acid content -----	84
2 – d Soluble sugars of mature roselle sepals -----	89
2 – e The element content of sepals -----	92
3 – Analysis of the mature roselle seeds -----	97
4 – Effect of GA ₃ and/or BA in absence and presence of Fe-EDTA on fiber yield, fiber properties and fiber Composition of roselle plant at harvesting	
4 – a Fiber yield -----	107
4 – b Fiber properties -----	108
4 – c Fiber composition -----	110

Effect of GA₃, BA and mixture of both in absence and presence of Fe-EDTA on some metabolic activities of roselle plants:

5 – Endogenous phytohormones	110
6 – Photosynthetic pigments	119
7 – Carbohydrate contents	125
8 – Nucleic acid contents	131
9 – Nitrogen contents	134
10 – Enzyme activities	140
-Phenylalanine ammonia lyase (PAL) enzyme	141
-Tyrosine ammonia lyase (TAL) enzyme	143
11 – Total phenol contents	143
12 – Titratable acidity and organic acid contents	146
13 – Mineral contents	149
