

Medical studies department

Insulin like Growth Factor-1 and Interleukin-6 Levels in serum of Low Birth Weight Infants and in Breast Milk: Relationship to Catch-up Growth

Thesis

Submitted for fulfillment of Ph.D in childhood studies
(Child Health and Nutrition)
Medical Studies Department

By

Maged Atta Fawzy El-Wakeel
M.B.B.Ch/ M.Sc Pediatrics
Cairo University

Supervised by

Prof. Dr. Khaled Hussein Taman
Professor of Pediatrics and
Dean of Institute of Postgraduate
Childhood Studies
Ain Shams University

Prof. Dr. Azza Abdel Shaheed Abdallah
Professor of Child Health
Child Health Department
National Research Centre

Prof. Dr. Karima Abbas Ibrahim
Prof. of Physiology
Medical Physiology Department
National Research Centre

Ain Shams University
2010

Acknowledgment

First and foremost, praise and thanks be to the Almighty (ALLAH) for his limitless help and guidance and peace be upon his prophet.

*I would like to express my deepest gratitude to **Prof. Dr. Khaled Hussein Taman**, Professor of Pediatrics and Dean of Institute of Postgraduate Childhood Studies for his great help, valuable guidance, and continuous encouragement through the whole research. I am deeply affected by his care and consideration. I am much honored to have him as my supervisor.*

*I wish also to express my sincere and deep appreciations to **Prof. Dr. Azza Abdel Shaheed Abdallah**, Professor of Child Health, National Research Centre for her continuous guidance, support and constructive criticism through the whole work. She has generously devoted much of her time and her effort for planning and supervision of this study.*

*And I am also deeply grateful and would like to express my deepest thanks to **Prof. Dr. Karima Abbas Ibrahim**, Prof. of medical Physiology, National Research Centre for her great help and contribution.*

*I could not forget the great help of **Prof. Dr. Gihan Ahmed Fathy**, Professor of Child Health, National Research Centre and her precious effort throughout this work.*

Last and not least special thanks are dedicated to all my professors, parents and colleges for their great help during the work

Maged El-Wakeel

List of abbreviations

- ABW: Appropriate birth weight
- ACTH: adrenocorticotropin hormone
- AGA: Appropriate for gestational age
- ALS: Acid labile subunit
- BHSD-2: Beta hydroxy-steroid dehydrogenase-2
- BNF: Brain-derived neurotropic factor
- cAMP: Cyclic adenosine mono-phosphate
- CNTF: ciliary neurotrophic factor
- CPAP: Continuous positive airway pressure
- CPH: carboxypeptidase H
- CSF: Cerebrospinal fluid
- CT-1: cardiotrophin-1
- CTL: cytotoxic T lymphocytes
- DC: dendritic cells
- DNA: Deoxyribonucleic acid
- EGF: Epidermal growth factor
- FGF: Fibroblast growth factor
- GH: Growth hormone
- GIT: Gastro-intestinal tract
- GM-CSF: Granulocyte-Monocyte Colony Stimulating Factor
- GMH: Germinal matrix haemorrhage

- gp 130: glycoprotein 130
- HGF: Hematopoietic growth factor
- IFN: Interferon
- Ig: Immunoglobulin
- IGF-1: Insulin-like growth factor-1
- IGFBP: Insulin-like growth factor binding protein
- IGF-II: Insulin-like growth factor
- IL: Interleukins
- IL6: Interleukins-6
- IUGR: Intrauterine growth retardation
- LBW: Low birth weight
- LC-PUFA: Long chain polyunsaturated fatty acids
- LIF: leukemia inhibitory factor
- L-S ratio: Lecithin-sphingomyelin
- MW: Molecular weight
- NBW: Normal birth weight
- NEC: Necrotizing enterocolitis
- NGF: Nerve growth factor
- NMR: Neonatal mortality rate
- NPO: Nothing per oral
- NSILA: non-suppressible insulin-like activities
- NT3: Neurotrophin 3
- OSM: oncostatin-M
- PCs: proprotein convertases

- PDGF: Platelet-derived growth factor
- PI-3K: phosphatidylinositol 3-kinase
- PMR: Perinatal mortality rate
- PTHrP: Parathyroid hormone–related protein
- PVL: Periventricular leukomalacia
- RDS: Respiratory distress syndrome
- RNA: Ribo-deoxynucleic acid
- ROP: Retinopathy of prematurity
- SDS: Standard deviation score
- SGA: Small for gestational age
- TGF: Tumor Growth Factor
- TGF- α : Transforming growth factor
- TGF- β : Transforming growth factor
- TH: Thyroid hormone
- TNF: Tumor Necrosis Factor
- VLBW: Very low birth weight

(37)	Negative correlation between serum IGF-1 and serum IL-6 at enrollment in the study	143
(38)	Correlation between serum IGF-1 and milk IGF-1 at enrollment in the study	144
(39)	Negative correlation between serum IGF-1 and serum IL-6 at 6th month of age	145
(40)	Correlation between serum IGF-1 and milk IGF-1 at 6th month of age	145
(41)	Negative correlation between serum IL-6 and body weight (SDS) at enrollment in the study	146
(42)	Negative correlation between serum IL-6 and body length (SDS) at enrollment in the study	147
(43)	Negative correlation between serum IL-6 and head circumference (SDS) at enrollment in the study	147
(44)	Negative correlation between serum IL-6 and body weight (SDS) at 6th month of age	148
(45)	Negative correlation between serum IL-6 and body length (SDS) at 6th month of age	149
(46)	Negative correlation between serum IL-6 and mid arm circumference (SDS) at 6th month of age	149
(47)	Correlation between milk levels of IGF-1 and body weight (SDS) at enrollment in the study	151

(48)	Correlation between milk levels of IGF-1 and head circumference (SDS) at enrollment in the study	152
(49)	Correlation between milk levels of IGF-1 and skin fold thickness (SDS) at enrollment in the study	152
(50)	Correlation between milk levels of IGF-1 and body weight (SDS) at 6th month of age	153
(51)	Correlation between milk levels of IGF-1 and length (SDS) at 6th month of age	154
(52)	Correlation between milk levels of IGF-1 and head circumference (SDS) at 6th month of age	154
(53)	Correlation between milk levels of IGF-1 and mid arm circumference (SDS) at 6th month of age	154
(54)	Correlation between delta changes of serum IGF-1 and delta changes of length (SDS)	158

Introduction

Low birth weight (LBW) is a newborn whose birth weight is less than 2500g (*Bailey and Byrom, 2006*). LBW is one of the main predictors of infant mortality. The global incidence of LBW is around 17%, although estimates vary from 19% in the developing countries to 5-7% in the developed countries (*Valero et al, 2004*)

There are many known risk factors, the most important of which are socio-economic factors, medical risks before or during gestation and maternal lifestyle (*Herbst et al, 2003*).

Catch-up growth was considered to be achieved when height, weight, and head circumference (HC) exceed -2SD of reference data and remained above this limit afterwards (*Brandt et al, 2003*). The magnitude of catch-up growth during infancy, especially the first 6 months of life, is most critical in decreasing risk at adult shortness (*Luo and Albertsson, 1998*). Fetal growth regulatory mechanisms, such as insulin-like growth factor-I and -II, are the primary growth mediators until 6 months of age (*Karlberg et al, 2002*)

(IGF-1) is a small, single-chain protein that is involved in many aspects of tissue growth and repair. It is similar in size, sequence, and structure to insulin, but has 100-1,000 fold lower

affinity for insulin receptors (*Mynarcik et al, 1997*). Although IGF-1 mRNA can be detected in many tissues, the majority of circulating IGF-1 is produced in the liver after stimulation by growth hormone (*Butt et al, 1999*)

The IGFs are involved in the regulation of growth during pregnancy as well as in early embryonic and fetal development. In most studies, cord blood IGF-1 concentrations correlate with birth weight (*Bettina et al, 2005*)

Researches have demonstrated that change in total IGF-1 (week 0 to week 3) was a positive predictor of postnatal weight gain, and that a good correlation was found between postnatal weight, length and IGF-1 (*Lo et al, 2005*). Also it was found that IGF-1 was significantly high in IUGR infants with catch-up growth with respect to IUGR infants without catch-up growth, indicating its importance in early catch-up growth of IUGR babies (*Ozkan et al, 1999*).

It has also been shown that IGF-1 is present in breast milk and its concentration is highest prepartum and early postpartum, coinciding with maximal proliferation of mammary cells. It is hypothesized to play a functional role in the growth and development of neonates (*Elmlinger et al, 2007*)

Interleukins are part of a larger class of polypeptides known as cytokines, these are messenger molecules that transmit signals between various cells of the immune system,
