ACKNOWLEDGMENT

First praise is to Allah, the Almighty, on whom ultimately we depend for sustenance and guidance. Second, I would like to express my sincere gratitude to my supervisor **Prof. Mahmoud Ahmed hewehy** for the continuous support of my Master study, for his patience, motivation, and immense knowledge and the useful comments through the learning process of this master thesis. Furthermore I would like to thank **Dr. Mohamed Mohamed Khalil El hakim** for his guidance helped me in all the time of research and writing of this thesis, for the support on the way.

My sincere thanks also goes to **Eng. Hamdy Eid**, who provided me an opportunity to join this thesis, and who gave permit to use available data at my company and research facilities. Without they precious support it would not be possible to conduct this research.

Also, I like to thank my colleagues, who have willingly shared their precious experience and time during the process of collecting data of this thesis.

Last but not the least, I would like to thank my family: my parents, my brothers and sisters, and to my wife for supporting me spiritually throughout writing this thesis and my life in general.

ABSTRACT

The continuing increase in demand for commercial aviation transport raises questions about the effects of Biodiesel as an alternative fuel for aircraft on the airports environment. The purpose of this study is to compare, assumption of using Soy biodiesel (B₂₀) as an Aircraft fuel on Sharm el-Sheikh International Airport's air quality vs. actual fuel used Diesel (Jet A1). The International Civil Aviation Organization (ICAO) defines standard power settings for jet engines at 7%, 30%, 85%, and 100% corresponding to the idle, approach, climb-out, and takeoff modes, respectively. These modes define the Landing and Takeoff (LTO) cycle developed as part of the jet engine certification process started in the 1970s. The results will only concentrate on the estimated emissions of from ground level to 9357ft (average mixing height layer). The estimated atmospheric emissions of aircraft operations at SSH for the year 2013 are presented in this paper. The landing and takeoff (LTO) emissions of hydrocarbons (HC), carbon monoxide (CO), nitrogen oxides (NO_x), and particulate matters (PM), were calculated using the flight data recorded by the Egyptian airports company. Emission factors from the International Civil Aviation Organization Engine Exhaust Emission Databank were used for different aircraft operation modes such as take-off, climb-out, approach, and taxi/idle engine conditions. Total LTO emissions from aircrafts at SSH were estimated as 442.047 t /year for HC, 37660.742 t /year for CO, 69340.331 t /year for NO_x, and 9.674 t /year for PM. The predicted total LTO emissions from aircrafts at SSH for the year 2050 were calculated as 4928.8241 t /year for HC, 419917.27 t /year for CO, 773144.69 t /year for NO_x, and 107.8651 t /year for PM. The aircrafts at SSH are the major sources of NO_x emissions (99.95%), Boeing 777 (large aircraft) has the biggest portions in NO_x total emissions, in which contributing 6.836t /LTO for NO_x.Flight numbers are expected to reach 483822 by 2050. That represents

5.42 % average annual growth in Flights at SSH. The emissions concentrations are normally well below the air quality limit values given in Law No. (4/2004) of Egypt and its amendment No. (9/2009), by the World Health Organization, and other different Countries guideline values. The assumption of use biodiesel (Soy biodiesel B₂₀) for aircraft engines at SSH for year 2013 leads to the substantial reduction in PM, HC and CO emissions 0.987 t/year, 93.272 t/year, and 4142.682 t/year, respectively accompanying with the increase in NO_x emission 1386.806 t/ year. Moreover, the prediction of reduction in emissions for year 2050 are estimated as 11.00505 t/year for PM, 1039.9828 t/ year for HC, and 46190.9043 t/year for CO, accompanying with the increase in NO_x emission 15462.8869 t/year. There are very little effect on emissions reduction when using biodiesel (Soy biodiesel B₂₀) for APU & aircraft handling comparing with aircraft main engines were estimated emissions reduction for APU during 2013 as 0.8023378 t/ year for HC, and 1.0155631 t/ year for CO, accompanying with the increase in NO_x emission 0.2479944 t/year and for aircraft handling as 1.5077697 t/ year for HC, and 1.1828047 t/ year for CO, accompanying with the increase in NO_x emission 0.6560550 t/ year. The measurement of average concentration of the regulated air emissions (HC, NO_x, CO) at distance away 8 km from Runway were estimated for using Diesel (Jet A1) as 0.8281 µg/ m³ for HC, and 4.617 µg/ m³ for CO, and 343.7607 µg/ m³ for NO_x, while for The assumption of use biodiesel (Soy biodiesel B₂₀) for aircraft engines as 0.6534 µg/ m³ for HC, and 4.1091 µg/ m³ for CO, and 350.6359 µg/ m³ for NO_x.

CONTENTS

Item NO.	Titles	Page NO.
Chapter 1 "Introduction"		
1.1	Aircraft and Airport air pollution emissions	1
1.1.1	Operational LTO Cycle	2
1.1.2	Aircraft emissions	4
1.1.2.A	Carbon Monoxide	5
1.1.2.B	Nitrogen Oxides	6
1.1.2.C	Unburned Hydrocarbons	7
1.1.2.D	Carbon Dioxide	8
1.1.2.E	Particulate Matter	8
1.1.2.F	Other Emissions	10
1.2	History of alternative fuels in aviation	11
1.3	Air Quality Limit values for Egypt	14
1.4	Air quality regulations and pollutant in different countries	15
1.5	Biodiesel Fuel	17
1.5.1	Background of Biodiesel	17
1.5.1.A	Advantages of the Use of Biodiesel	18
1.5.1.B	Disadvantages of the Use of Biodiesel	19
1.5.2	Raw Materials for Biodiesel Production	20
Chapter 2 "Review of Literature"		
2.1	Background of Aviation	22
2.2	Availability and usage of alternative fuels	24
2.3	Cost of conversion and sustainability	27
2.4	Safety factors	29
2.5	Research on Typical Biofuels as Aviation Alternative Fuel Purpose	30
2.6	Real Flight Test Demonstration	35
Chapter 3 " Biodiesel "		
3.1	Benefits of Use	36
3.1.1	Biodiesel Provides a High Energy Return and Displaces Imported Petroleum	36

3.1.2	Biodiesel Reduces Life-Cycle Greenhouse Gas Emissions	36
3.1.3	Biodiesel and Human Health	37
3.1.4	Biodiesel Improves Engine Operation	37
3.1.5	Biodiesel Is Easy To Use	38
3.1.6	Lower Energy Density	38
3.1.7	Low-Temperature Operability	39
3.1.8	Storage Stability	39
3.2	Biodiesel (B ₁₀₀)	40
3.2.1	Quality Specification of B ₁₀₀	43
2.2.2	Energy Content	49
3.2.3	Low-Temperature Properties	50
3.2.4	Cetane Number	53
3.3	Biodiesel Blends	54
3.3.1	Specifications	55
3.3.1.A	B ₅ and Lower Blends	55
3.3.1.B	B ₆ to B ₂₀ Blends	55
3.3.2	Low-Temperature Properties	57
Chapter 4 " Materials and Methods"		
4.1	Methodology for the estimation of aircraft engine/ APU emissions	59
4.1.1	Emission calculation for aircraft main engines advanced approach	59
4.1.1.A	Time-in-mode calculation	60
4.1.2	Auxiliary power –unit emissions calculation methodology	61
4.2	Flights Forecasting using series Linear regression Model	62
4.3	Methodology for calculation of pollutants concentration at ground level	62
4.4	Methodology for calculation of the Ground level concentration for NO _x , HC, CO, and PM in the case of using Diesel & assumption of using Soy biodiesel (B ₂₀) as a fuel for aircraft types B737 & A320 at the following downwind: 1km, 2km, 3km, 4km, 5km, 6km, 7km, and 8km.	63

4.5	Methodology for calculation of Ground Service Equipment emissions by use Secondary simple approach method	64
4.6	Methodology for measurements of Air pollutions at SSH.	64
Chapter 5 "Results and Discussions" "Part 1: Evaluation of Air quality for Sharm El Sheikh International airport where diesel used as aircraft engines fuel"		
5.1	Sharm El Sheikh International Airport	65
5.1.1	Description of the environment	65
5.1.1.A	Meteorology and Climate	65
5.1.1.B	Geology and Topography	67
5.1.1.C	Airport layout	67
5.1.1.D	Air traffic density	69
5.1.2	Airport related emission sources	76
5.1.2.A	Aircraft emissions	76
5.1.2.A.1	Aircraft main engines emissions	77
5.1.2.A.1.1	Time-in-mode (TIM)	79
5.1.2.A.1.2	Emission index (EI) and fuel flow	83
5.1.2.A.2	Calculation of Auxiliary power unit (APU) emissions	144
5.1.2.B	Aircraft handling emissions	193
5.1.2.B.1	Egyptair Ground Services company	197
5.1.2.B.2	EAS Company	199
5.1.3	Concentrations downwind from the RWY	205
5.1.3.A	Average concentrations	205
5.1.3.B	Peak hour concentrations from flight activities	216
5.1.3.C	Estimated impact from road traffic	219
Chapter 6 "Results and Discussions" "Part 2: Evaluation of Air quality for Sharm El-Sheikh International airport by assuming replacement of diesel to biodiesel as an alternative fuel for aircraft engines"		
6.1	Comparison between emissions emitted from biodiesel and diesel fuel	222
6.2	Assumption effect of using soy-Biodiesel (B ₂₀) as a fuel for Aircraft engines	223

6.2.1	Soy Biodiesel physic-chemical characteristics	223
6.2.2	Total calculated emissions mass for landing and takeoff cycle of aircraft different types on five days at SSH when assumption of using Soy biodiesel (B ₂₀) for Aircraft engines	225
6.2.3	Comparison between total calculated emissions mass for landing and takeoff cycle of aircraft different types on Five days at SSH when using Diesel & assumption of using Soy biodiesel (B ₂₀) for Aircraft engines	230
6.2.4	Comparison between total calculated emissions mass for all Aircraft at SSH during 2013 & 2050 when using Diesel & assumption of using Soy biodiesel (B ₂₀) for aircraft engines.	236
6.2.5	Calculation of the pollutants dispersion concentration of NO _x , HC, CO, and PM emitted from aircraft engines during take-off operation to compare using of Soy biodiesel (B ₂₀) and Diesel as an aircraft fuel	240
6.2.6	Calculation of the Ground level concentration for NO _x , HC, CO, and PM in the case of using Diesel & assumption of using Soy biodiesel (B ₂₀) as a fuel for aircraft types B737 & A320	249
6.2.6.A	Calculation of the Ground level concentration for NO _x in the case of using Diesel & assumption of using Soy biodiesel (B ₂₀) as a fuel for aircraft type B737	252
6.2.6.B	Calculation of the Ground level concentration for HC in the case of using Diesel & assumption of using Soy biodiesel (B ₂₀) as a fuel for aircraft type B737	256

6.2.6.C	Calculation of the Ground level concentration for CO in the case of using Diesel & assumption of using Soy biodiesel (B ₂₀) as a fuel for aircraft type B737	260
6.2.6.D	Calculation of the Ground level concentration for PM in the case of using Diesel & assumption of using Soy biodiesel (B ₂₀) as a fuel for aircraft type B737	64
6.2.6.E	Calculation of the Ground level concentration for NO _x in the case of using Diesel & assumption of using Soy biodiesel (B ₂₀) as a fuel for aircraft type A320	272
6.2.6.F	Calculation of the Ground level concentration for HC in the case of using Diesel & assumption of using Soy biodiesel (B ₂₀) as a fuel for aircraft type A320	276
6.2.6.G	Calculation of the Ground level concentration for CO in the case of using Diesel & assumption of using Soy biodiesel (B ₂₀) as a fuel for aircraft type A320	280
6.2.6.H	Calculation of the Ground level concentration for PM in the case of using Diesel & assumption of using Soy biodiesel (B ₂₀) as a fuel for aircraft type A320	284
