### ACKNOWLEDGMENT

All thanks to **ALLAH**, First and last for his countless gifts to me.

I would like to express my gratitude to **Prof. Dr. Hani Mohamadi**, Professor of Orthopaedic Surgery, for suggesting, his supervision, kind guidance, patience and continuous support.

I would like to express my deepest gratitude & appreciation to **Prof. Dr.Hisham Abdel Ghani** Professor of Orthopaedic Surgery, for his kind patience, kind guidance, and continuous support.

My deepest thanks and appreciation should go to **Dr. Mahmoud Abdel Karim**, Lecturer of Orthopaedic Surgery, Cairo University for his constant guidance and constructive criticism and his continuous support.

My deepest thanks and appreciation should also go to **Dr. Ahmed Hazem**, Lecturer of Orthopaedic Surgery, Cairo University, for his help, constant encouragement, continuous Support and everlasting skillful help.

Their favors will never be forgotten.

Then, I would like to extend my sincere gratitude to my family. Then I would like to express my deepest thanks and appreciation to **my mother** for her support all over my life.

### **ABSTRACT**

<u>Introduction:</u> Surgical procedures with use of traditional techniques to reposition the proximal femoral epiphysis in the treatment of slipped capital femoral epiphysis are associated with a high rate of femoral head osteonecrosis. Therefore, most surgeons advocate in situ fixation of the slipped epiphysis with acceptance of any persistent deformity in the proximal part of the femur. This residual deformity can lead to secondary osteoarthritis resulting from femoroacetabular cam impingement.

Objective: The primary aim of our study was to report the results of the technique of capital realignment with Ganz surgical hip dislocation and its reproducibility to restore hip anatomy and function. In this study we looked for: (1) Radiological outcome, slip angle and alpha angle. (2) The incidence of major complications especially AVN. (3) Clinical outcome with recording the range of motion of the hip and evaluating short-term clinical scores (Merle d'Aubigne'-Harris hip score -WOMAC). (4) The extent of intra-articular damage and relating this to clinical stability and symptom duration. (5) Comparing our results to what was reported in the literature.

<u>Patients and Methods:</u> This prospective case series study included thirty-one patients (32 hips, 21 Lt hip and 11 Rt hip) with stable chronic slipped capital femoral epiphysis after surgical correction with a **modified Dunn** procedure.

This study included 26 males and 5 females. The mean age of our patients was 14.26 years (11-17 years). The mean duration of symptoms before the operation was 8.42 month (1 -26 months). Mean follow up period was 16.11 month (7-40 month).

The mean preoperative Alpha angle was  $99.97^{0}$  (range  $87^{0}$  -  $109^{0}$ ). The mean preoperative Slip angle was  $56^{0}$  (range  $40^{0}$ - $75^{0}$ ).

Harris hip score was done for all patients pre operatively and its mean was 67.91 (ranged from 61-74), mean Womac score was 64.03 (range 54-72), mean Merle d'Aubigne score was 12.09 (range 11-14).

Results: Twenty-seven patients, (28 hips) had excellent clinical and radiographic outcomes with respect to hip function and radiographic parameters. Four patients had fair to poor clinical outcome including 2 patients developed AVN, one case of deep infection and a case of limited flexion. The difference between those who developed AVN and those who didn't develop AVN was statistically significant in postoperative clinical scores (p 0.000).

The mean slip angle of the femoral head was  $56^{0}$  preoperatively and was corrected to a mean value of  $12^{0}$  postoperatively with mean correction of  $44^{0}$  (p 0.000). Mean postoperative Alpha angle was  $47^{0}$  (ranged from  $25^{0}$ - $60^{0}$ ), with mean correction of  $53^{0}$ (p 0.000).

Post operative flexion was ranged from 30 to 130 with mean of 104.34. Post operative IR in  $90^{0}$  flexion was ranged from 10 to 50 with mean of 40.Post operative ER in  $90^{0}$  flexion was ranged from 15 to 60 with mean of 45.

As regarding postoperative HHS, in our series its mean was 96.3 (ranged from 65 to 100) mean correction was 28.5 (p 0.000). Mean WOMAC score was 97 (ranged from 72 to 100) with mean correction of 33 (p 0.000). Mean Merle d'Aubigne score was 16.8 (ranged from 10 to 18) with mean correction of 4.8 (p 0.000).

<u>Conclusions:</u> This study showed that the treatment of slipped capital femoral epiphysis with the **modified Dunn** procedure allows the restoration of normal proximal femoral anatomy by complete correction of the slip angle, such that probability of secondary osteoarthritis and femoroacetabular cam impingement may be minimized. It also allowed direct inspection, preservation of physeal blood supply and inspection of intra-articular pathology which can be evaluated and treated at the time of operation.

The complication rate from this procedure in our series was low as compared to what was reported in other series in the literature.

# INTRODUCTION AND AIM OF THE STUDY
