

**Assessment of Respiratory Muscles
Performance in Patients with Chronic Renal
Failure Immediately before and after
Hemodialysis**

Thesis

*Submitted for Partial fulfillment of MD Degree in Chest Diseases and
Tuberculosis*

Presented by
Dina Fathy Gaber Awad
M.B.B.Ch.,M.Sc.

Under Supervision of
Professor / Laila Ashour Helala

Professor of Chest Diseases
Faculty of Medicine
Ain Shams University

Dr./Khaled Mohamed Wagih Helmy

Assistant professor of chest diseases
Faculty of Medicine
Ain Shams University

Dr. / Hesham Atef Abd El Haleem

Assistant professor of chest diseases
Faculty of Medicine
Ain Shams University

Dr. / Walid Ahmed Bichari

Lecturer of nephrology
Faculty of Medicine
Ain Shams University

ACKNOWLEDGEMENT

Thanks first and last to Allah as we owe him for his great care, support and guidance in every step in our life.

*It really gives me unlimited pleasure and honor to express my sincere heartfelt gratitude of **Prof. Laila Ashour** Professor of chest diseases Faculty of Medicine Ain Shams University who has contributed in this work with valuable assistance and in many different ways. I would like to thank her for devoting much of her time to helpful comments and also for her effort throughout this work and kind supervision.*

*It gives me pleasure to express my great indebtedness and appreciation to **Assistant prof. Khaled Wagih**, also my great indebtedness and appreciation to **Assistant Prof. Hesham Atef**, Professors of chest diseases Faculty of Medicine Ain Shams University for their kind supervision, unrelenting support, continuous encouragement, valuable scientific guidance, unlimited help and indispensable advice.*

*It gives me pleasure to express my great indebtedness and appreciation to **Prof. Walid Bechari** Lecturer of Nephrology .Faculty of Medicine, Ain Shams University.*

A special word of thanks is directed to all members of the chest department for their helpful advice and constructive criticism.

*Finally, but of major importance I would like to express my deepest thanks and profound gratitude to **my family** for their continuous encouragement during the course of this study.*

$V'_{(t)}$	Instantaneous flow.
VC	Vital capacity.

Introduction

Chronic renal failure (CRF) is characterized by progressive and irreversible destruction of renal structures. The respiratory system suffers alterations in respiratory drive, pulmonary mechanics, muscle function and gas exchange. This pulmonary dysfunction may be a direct result of the circulation of toxins or, indirectly, from the excess volume due to the increased quantities of circulating body fluids, anemia, immunological suppression, drugs and deficient nutrition (*David J. and Pierson, 2006*).

Among (CRF) patients undergoing dialysis, hemodialysis (HD) is the most frequently used modality (90.7%). Such intervention is usually performed three times a week, three to four hours per session. Although advances in HD have improved the survival of those patients, significant changes in their quality of life have been shown. The physical functioning of such patients has been shown to be decreased, including a reduction in physical activity, muscle weakness, anemia, and several metabolic and hormonal alterations (*Chemma BSB. and Sing MAF., 2005*).

Physiological abnormalities are frequent in the skeletal muscle structure of patients with (CRF), and their main signs are fatigue, muscular weakness and low exercise tolerance. Respiratory

muscular weakness may lead to hypoventilation, maximum respiratory pressure measurements may help in early diagnosis and therapeutic interventions for these patients (*Sala et al., 2001*).

Maximum inspiratory (PI_{max}) and expiratory (PE_{max}) pressures produced during static efforts are considered a reflex of the strength of the respiratory muscles. The relations of those maximum static pressures to general muscle development have been described by some authors (*Rocha and Araújo, 2010*).

The most widely used test for assessing the overall strength of inspiratory and expiratory muscles consists in measuring maximum static mouth pressures. Those tests have the advantage of being non invasive and normal values have been well established in adults (*Rocha and Araújo, 2010*).

Aim of the work

The aim of this study is to assess the respiratory muscle performance by measuring the maximum inspiratory pressure (MIP) and maximum expiratory pressure (MEP) in chronic renal failure patients immediately before and after hemodialysis.
