

Impact of Scissors Type Used for Episiotomy on The Prevalence of Obstetric Anal Sphincter Injury: Randomised Controlled Trial

Thesis

Submitted for Partial Fulfillment of the Requirements
Of Masters Degree in Obstetrics and Gynecology

By

Amany Salah El Din Abd El Hafeez

M.B.B.Ch. (2012), Faculty of Medicine, Ain Shams University
Resident of obstetrics and gynecology at El Sheikh Zayed Hospital

Under supervision of

Dr. Ahmed Hussein Salama

*Assistant Professor of Obstetrics and Gynecology
Faculty of Medicine, Ain Shams University*

Dr. Noha Abd El-Sattar Sakna

*Lecturer of Obstetrics and Gynecology
Faculty of Medicine, Ain Shams University*

Dr. Mohamed Hamed Salama

*Lecturer of Obstetrics and Gynecology
Faculty of Medicine, Ain Shams University*

Ain Shams University

2017

Acknowledgments

I am grateful to Allah for his grace and blessings which helped me to accomplish this study.

Immeasurable appreciations to my dear professors for their great help.

I would like to express my thanks and gratitude to **Dr Ahmed Husseiny Salama** for his advice, guide and valuable time .

I would also like to thank my dear **Dr Noha Abd El-Sattar Sakna** for being kind, decent and helpful.

No words can express how much I appreciate the great, generous and kind help of **Dr Mohamed Hamed Salama**. I owe to him my every single point of knowledge in Obstetrics and Gynecology. He taught me how to make a research and find the recent updates in every topic. He was keen, generous and did not spare his time and efforts for the sake of this study. It is great honor to me that I learnt much from him.

My heartfelt thanks to the best mother in the world. My kind mum **Hayat Gharib** who helped me in every step in my path, she lightens my way to success, she is

Allah's hand on earth to help me. Thanks mum for being sincere, lovable and supporting mother.

My lovable husband Dr **Mohammed Hatem** thanks for your support and understanding of the hard times I passed through to fulfill this study. I wish you success and I hope you will be the one of the best surgeons in the world.

My sweet baby **Asser**, you are my source of power to struggle and survive in this life. I am working hard to hear from you that you are proud of your successful mother. One day I will stand proudly saying my son is a great man.

INTRODUCTION

Episiotomy is an incision of the perineum to enlarge the vaginal opening and facilitate delivery (**Mullally *et al.*, 2011**). It shouldn't be done routinely in normal vaginal delivery but restrictive episiotomy is done in some situations as fetal distress and instrumental vaginal delivery (**NICE guidelines 2015**). It should be done at time of fetal head crowning (**Rusavay *et al.*, 2015**).

Episiotomy types are median, mediolateral, lateral, J-shaped and anterior episiotomy. Mediolateral episiotomy is the most frequent type used which extends from midline laterally and downwards away from the rectum (**Kalis *et al.*, 2012**). Median episiotomy has the advantage of less scarring, better cosmetic healing and less blood loss, while mediolateral episiotomy has less incidence of rectal injury (**Goldman *et al.*, 2003**).

Mediolateral episiotomy angle should be between 45 and 60 degree to avoid perineal tears (**Lappen *et al.*, 2010**). The angle of mediolateral incision is different at the time of incision from that after repair. The post incision angle of 60 and 40 degree is 40 and 22.5 degree respectively (**Kalis *et al.*, 2008**).

Median episiotomy should be approximately one half the length of the perineum. Perineum is the distance from posterior forchette to middle of anal opening (**Goldman *et al.*, 2003**).

Different types of scissors have been used in cutting episiotomies such as straight, curved and angled scissors. It is thought that curved or angled scissors produce incision away from anal sphincter. However, Obstetric guidelines don't provide sufficient data on comparison of use of different scissors on episiotomy (**Swift *et al.*, 2014**).

Episiotomy can be complicated by bleeding, pain, infection, dyspareunia, perineal tears and obstetric anal sphincter injuries (**Sooklim *et al.*, 2007**).

Perineal tears occurring during vaginal delivery affect women's wellbeing (**Necosalova *et al.*, 2016**). Severe perineal tears may involve anal sphincter which may have comorbidities as perineal pain, rectovaginal fistula and anal incontinence (**Harvey *et al.*, 2015**).

Obstetric anal sphincter injuries (OASIS) is known to be a major risk factor for anal incontinence in women, leading to nine times increase in anal incontinence compared with men. Anal incontinence (ie, incontinence
