

# **Recent Updates in Anesthetic Management of Coagulation Disorders in Obstetric Patients**

*Essay*

*Submitted for Partial Fulfillment the Master Degree  
in Anesthesia*

*By*

**Maram Osama Mohamed Abd Elbary**

*M.B. B.Ch.*

*Supervised by*

**Prof. Dr. Hala Gomaa Salama Awad**

*Prof. of Anesthesia, Intensive Care and Pain Management  
Faculty of Medicine, Ain Shams University*

**Dr. Sherif George Anis Said**

*Assistant Prof. of Anesthesia, Intensive Care and Pain Management  
Faculty of Medicine, Ain Shams University*

**Dr. Hany Magdy Fahim Hanna**

*Lecturer of Anesthesia, Intensive Care and Pain Management  
Faculty of Medicine, Ain Shams University*

**Faculty of Medicine**

**Ain Shams University**

**2018**

## Acknowledgment

- ✍ First and last praise to Allah.
- ✍ It is a great honor to express my sincere gratitude and appreciation to Prof. Dr. Hala Gomaa Salama Awad, Prof. of Anesthesia, Intensive Care and Pain Management, Faculty of Medicine, Ain Shams University, for her unfailing interest, untiring help, keen supervision and support.
- ✍ I am grateful to Prof. Dr. Sherif George Anis Said, Assistant Prof. of Anesthesia and Intensive Care, Faculty of Medicine, Ain Shams University, for his kind suggestion and scientific supervision.
- ✍ I am also grateful to, Dr. Hany Magdy Fahim Hanna, Lecturer Prof. of Anesthesia, Intensive Care and Pain Management, Faculty of Medicine, Ain Shams University for his encouragement, his kind support and appreciated suggestions that guided me to accomplish this work
- ✍ Finally this work could not have happened without My family and my dear friends who always supported me in everything.

## List of Abbreviations

<b>A</b>	: Current amplitude
<b>A5 A10, and A15</b>	: Amplitude at specific minute interval; ten and fifteen minutes
<b>AA</b>	: Arachidonic acid
<b>ACC/AHA</b>	: American College of Cardiology/American Heart Association
<b>ACS</b>	: Acute coronary syndromes
<b>ADAMTS13</b>	: A Disintegrin And Metalloproteinase with Thrombospondin type 1 motif, member 13
<b>ADP</b>	: Adenosine diphosphate
<b>AFLP</b>	: Acute fatty liver of pregnancy
<b>Alpha</b>	: $\alpha$ -angle
<b>AMR</b>	: Ashwell- Morrell receptor
<b>APC</b>	: Activated protein C
<b>aPTT</b>	: Activated partial thromboplastin time
<b>ASRA</b>	: American Society of Regional Anesthesia and Pain Medicine
<b>ATP</b>	: Adenosine triphosphate
<b>cAMP</b>	: Cyclic adenosine monophosphate
<b>CFT</b>	: Clot formation time
<b>CI</b>	: Coagulation index
<b>CT</b>	: Clotting time

## *List of Aberrations*

---

<b>cTTP</b>	: Congenital Thrombocytopenic Purpura
<b>DDAVP</b>	: Desmopressin
<b>Deg</b>	: Degree
<b>DIC</b>	: Disseminated intravascular coagulopathy
<b>EPCR</b>	: Endothelial proteoin c receptor
<b>EPL</b>	: Estimated per cent lysis
<b>ESA</b>	: European Society of Anesthesiologists
<b>ESC</b>	: European Society of Cardiology.
<b>EVs</b>	: Extracellular vesicles
<b>FAO</b>	: Fatty acid oxidation
<b>FAOD</b>	: Fetal fatty acid oxidation defects
<b>FDA</b>	: Food and drug administration
<b>fdp</b>	: Fibrin-degradation products
<b>FEIBA</b>	: Factor Eight Inhibitor Bypassing Activity
<b>FFP</b>	: Fresh frozen plasma
<b>G</b>	: Clot strength
<b>GPIb</b>	: Glycoprotein 1 beta
<b>GPVI</b>	: Glycoprotein VI
<b>HDL</b>	: High-density lipoprotein
<b>HELLP</b>	: Hemolysis elevated liver enzymes and low platelet count
<b>HIT</b>	: Heparin-induced thrombocytopenia
<b>HMWK</b>	: High-molecular-weight kininogen

<b>Humate-P</b>	: Antihemophilic factor–von Willebrand factor complex
<b>HUVEC</b>	: Human umbilical vein endothelial cells
<b>IL-1b</b>	: Interlukin 1 beta
<b>INR</b>	: International normalized ratio
<b>ITP</b>	: Idiopathic thrombocytopenic purpura
<b>K</b>	: Kinetics time
<b>LCHAD</b>	: Long-chain 3-hydroxyacyl-CoA dehydrogenase deficiency
<b>LMWH</b>	: Low-molecular-weight heparin
<b>LY30</b>	: Clot lysis at 30 minutes
<b>LY60</b>	: Clot lysis at 60 minutes
<b>MA</b>	: Maximal amplitude
<b>MCAD</b>	: Medium chain acyl-CoA dehydrogenase
<b>MCF</b>	: Maximum clot firmness
<b>MTP</b>	: Mitochondrial trifunctional protein
<b>NLRP3</b>	: Nuclitide binding domain and lucine rich repeat containing proteins
<b>PAF</b>	: Platelet-activating factor
<b>PAI</b>	: Plasminogen activator inhibitor
<b>PCC</b>	: Prothrombin complex concentrate
<b>PE</b>	: Phosphatidylethanolamine
<b>PF4</b>	: Platelet factor 4
<b>Pg</b>	: Plasminogen

<b>PGI2</b>	: Prostacyclin
<b>PIVKAs</b>	: Proteins formed in vitamin K absence
<b>PLA2</b>	: Phospholipase A2
<b>Pm</b>	: Plasmin
<b>PMA</b>	: Projected maximal amplitude
<b>PPH</b>	: Post partum hemorrhage
<b>PS</b>	: Phosphatidylserine
<b>PT</b>	: Prothrombin time
<b>R</b>	: Reaction time
<b>RCoA</b>	: Ristocetinco factor
<b>rFVIIa</b>	: Recombinant activated factor VII
<b>RIPA</b>	: Ristocentin-induced platelet aggregation
<b>ROS</b>	: Reactive oxygen species
<b>ROTEM</b>	: Thromboelastometry
<b>SCAD</b>	: Short chain acyl-CoA dehydrogenase
<b>sFlt-1</b>	: Soluble fms tyrosine kinase-1
<b>TAFI</b>	: Thrombin-activatable fibrinolysis inhibitor
<b>TEC</b>	: Thromboembolic complications
<b>TEG</b>	: Thromboelastography
<b>TF</b>	: Tissue factor
<b>TFPI</b>	: Tissue factor pathway inhibitor
<b>TM</b>	: Thrombomodulin
<b>t-PA</b>	: Tissue plasminogen activator
<b>TPO</b>	: Thrombopoietin receptors

<b>TTP</b>	: Thrombocytopenic purpura
<b>TXA</b>	: Tranexamic acid
<b>TXA2</b>	: Thromboxane A2
<b>UFH</b>	: Unfractionated heparin
<b>VKAs</b>	: Vitamin K antagonist
<b>VKORC</b>	: Vitamin K epoxide reductase
<b>VLCAD</b>	: Very long chain acyl-CoA dehydrogenase
<b>VLDL</b>	: Very low-density lipoprotein
<b>VTE</b>	: Venous thrombo embolism
<b>vWF</b>	: Von Willebrand factor
<b>VII</b>	: Stable factor
<b>IX</b>	: Christmas factor
<b>XI</b>	: Plasma thromboplastin
<b>XII</b>	: Hagman factor
<b>XIII</b>	: Fibrin stabllizing factor

## List of Tables

Table No.	Title	Page No.
<b>Table (1)</b>	Hemostatic changes during pregnancy	25
<b>Table (2)</b>	Von Willebrand disease types	29

<b>Figure (12)</b>	rFVIIa mechanism of action	104

## Introduction

The process of hemostasis is complex and is further complicated in the parturient because of the physiological changes of pregnancy. Understanding these changes and the impact that they have on the safety profile of the anesthetic options for labour and delivery is crucial to any anesthetist caring for the parturient (*Abbassi et al., 2009*).

These changes include physiological anemia and fluctuating coagulation factor concentrations alter the balance between bleeding and clot formation in preparation for peripartum blood loss (*Prisco et al., 2005*).

Coagulopathy may be caused by reduced levels or absence of blood-clotting proteins, known as clotting factors or coagulation factors. Genetic disorders, such as hemophilia and Von Willebrand's disease, can cause a reduction in clotting factors. Anticoagulants such as warfarin will also prevent clots from forming properly. Coagulopathy may also occur as a result of dysfunction or reduced levels of platelets (small disk-shaped bodies in the bloodstream that aid in the clotting process) (*Spahn et al., 2013*).

Thromboelastography and rotational thromboelastometry are point of-care tests used to measure whole blood coagulation, including fibrinolysis. Thromboelastography is useful because it encompasses, and is sensitive to, all the cellular and plasma factors in whole blood involved in clot formation and degradation. It is widely used within a number of hospital settings including intensive care and among patients undergoing liver and cardiac surgery (*Figuerola et al., 2014*).

Although attempts at establishing peripartum reference ranges for rotational thromboelastometry have been made, these ranges have not yet been widely accepted or validated. There are few longitudinal data demonstrating how the normal hemostatic changes that occur throughout pregnancy and the puerperium affect thromboelastography parameters (*Antony et al., 2015*).

It has long been postulated that women become hypercoagulable as pregnancy progresses, but how these changes directly affect clot mechanics is poorly understood. It has been confirmed the hypercoagulable status of women at term through thromboelastography analysis. Similarly, a shift toward hypercoagulability as measured by thromboelastography and rotational thromboelastometry

has been reported in uncomplicated pregnancies as pregnancy advances (*Sharma et al., 2013*).

Globally, postpartum hemorrhage (PPH) is the leading cause of maternal morbidity and mortality. In the UK, PPH with blood loss of more than 500 mL occurs in approximately 18% of births, with approximately 4% of births being associated with significant PPH, defined as blood loss of more than 1000 mL. Although there is a growing a focus on thromboelastography/rotational thromboelastometry in guiding PPH management, uptake of this technology for clinical use in obstetric units has been slow (*Allard et al., 2014*).

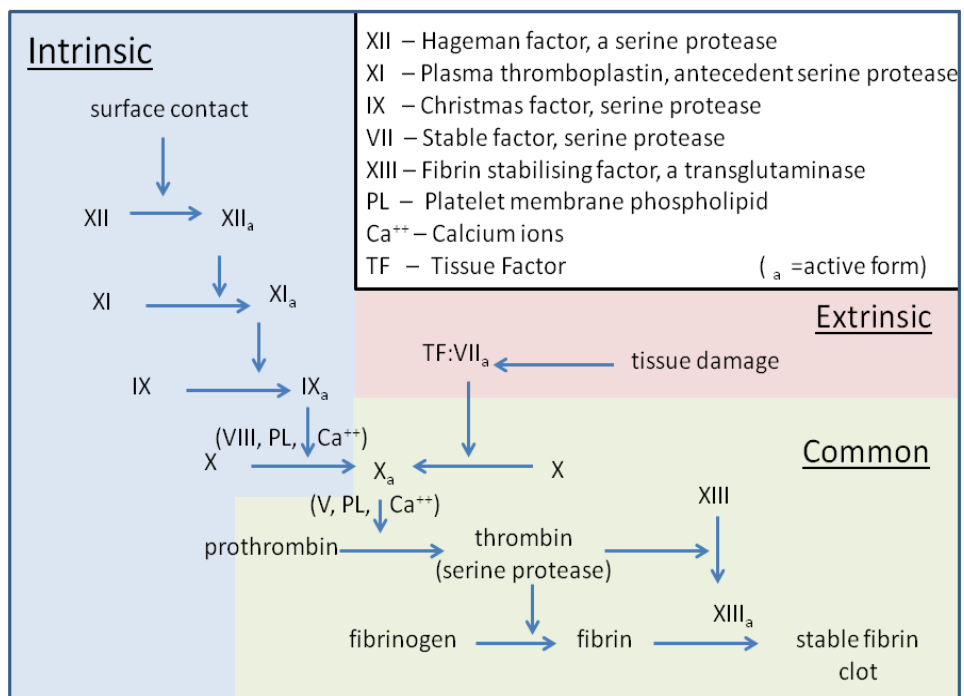

The overall estimated risk of epidural or spinal hematoma after neuraxial anesthesia in the obstetric population is 1:168000 (*Ruppen et al., 2005*).

The instances of anesthesia-related spinal hematoma in pregnant and non-pregnant patients and found that it most often occurred in patients with coagulopathies (68%) (*Hoffman et al., 2007*).

The anesthetic management of the obstetric patient with hematologic disease requires establishing a plan for anesthesia that incorporates the patient's specific hematologic problem, comorbidities, and the obstetric situation (*O Riordan et al., 2005*).

## Physiology of Coagulation Process

Coagulation is the process by which blood changes from liquid to a gel, forming a blood clot. It begins almost instantly after an injury to the blood vessel has damaged the endothelium lining the vessel. Leaking the blood through the endothelium initiates two processes: changes in platelets, exposure of subendothelial tissue factor to plasma factor VII, which ultimately leads to fibrin formation.

**Figure (1):** Classical blood coagulation pathway (*Pallister and Watson, 2010*).
