Acknowledgement

Praise to GOD, lord of the world, by the grace of whom implementation of this work was possible.

The author would like to express her greatest and deepest gratitude to **Prof. Dr. Ezzat Ali Korany**, for supervising this work, giving me a lot of his experience, time, effort and creative suggestions during all stages of this thesis, and thorough revision of manuscript.

Heartfelt thanks to **Prof. Dr. Ibrahim Hassan Himida**, for his continuous supervision during the whole time of the current work, giving me a lot of his experience, fruitful suggestions, critical reading of the manuscript and continuous encouragement and help, which are much appreciated.

I am deeply indebted with greatest thank to **Prof. Dr. Yehia Loutfy Ismail**, for supervising this work, the effective help in pumping tests calculations, help in infiltration tests with calculations and field work, continuous advising during this work and continuous encouragement.

Many warmest thanks are due to **Dr. Samah Mahmoud Morsy**, for useful advice and guidance during the supervision of this work.

Many thanks are due to **Dr. Ezz El Din El Tablawi**, for his great help in the mathematical model development and continuous encouragement.

Special thanks for **Prof. Dr. Mohamed Abdellah Khaled** and geologist **Ahmed Abd El Malek Salem** for providing technical help in the lithology of some wells. Thanks are extended to Mr. **Ibrahim Sobhy** for his sincere help in the field trips.

Finally, I wish to express my gratitude and appreciation to my family for their patience and continuous encouragement.

ABSTRACT

Wadi El Farigh area is considered as one of the most important areas in the North of the Western Desert of Egypt. It depends on groundwater of Lower Miocene aquifer as the main source for agricultural and human resources development. However, due to an imbalance of groundwater regime in lower Miocene aquifer, the current study has been conducted. The minimum and maximum temperature, average relative humidity, wind speed, precipitation, degree of aridity and evaporation are estimated. Also, a calculation of groundwater recharge and groundwater extraction rates was carried out, as well as the determination of the groundwater movement and evapotranspiration estimation of the planted areas using known scientific methods.

The main goals are to protect and manage the groundwater resources in the Lower Miocene aquifer in the studied area, and to prevent the lowering in the groundwater level which may lead to deterioration in groundwater quality. These goals are attained by developing a mathematical model that represents the hydrogeological conditions of the area through which thirteen scenarios are conducted for predicting the hydrological situations at different hydrological stresses in the next ten and twenty years. The obtained results indicate that

the hydraulic conductivity varies from 0.1 m/day to 25 m/day, the transmissivity coefficient varies between 1000 m²/day to 7000 m²/day, and the specific yield varies from 0.011 to 0.32. In the current study, the amount of groundwater extracted from the Lower Miocene aquifer in the studied area as well as the loss in the amount of groundwater storage were estimated during a hydrological year and for the next ten and twenty years

Some alternative investment plans of groundwater resources in the area, other than the current situation were proposed to predict future environmental situation in case of further development in the studied area. The scenario representing a discharge rate amounts to 98.83×10^6 m³/year has been chosen to be the best scenario for investment. It represents a total amount of groundwater extraction from the Lower Miocene aquifer in the studied area which is nearly equals the safe yield of the groundwater extraction (97.73×10^6 m³/year). The scenario that represents a discharge rate amounts to 289.35×10^6 m³/year has been chosen to be the worst scenario for investment. It shows an example of bad exploitation plans of the groundwater resources in the area, where environmental damages may result from such destructive strategies.
