This thesis for Master degree has been approved by :

Prof. Dr. Ahmed H.A. Khereba

-

Prof. Dr. Horticulture, Faculty of Agric.,
Cairo University.

Prof. Dr. Refaat Mohamed Helal

-

Prof. of Vegetable, Faculty of Agric.,
Ain Shams University

Prof. Dr. Khalifa Attia Okasha

-

Prof. Dr. Horticulture, Faculty of Agric.,
Ain Shams University.

Date of examination / /1998

ACKNOWLEDGMENT

**First and foremost, I feel always indebted to Allah,
the most beneficent and merciful**

I wish to express deep sense of gratitude to professor Dr. Khalifa Attia Okasha, Prof. of Horticulture, Faculty of Agriculture, Ain Shams University for his supervision, true assistance, valuable help and continuous encouragement.

Deepest and sincere gratitude to Dr. Mohamed Emam Ragab, Assistant Professor of Vegetable crops, Department of Horticulture, Faculty of Agriculture, Ain Shams University for his supervision, true assistance, great help and patience in the preparation of this thesis.

The author wishes as well, to express his appreciation and gratitude to Professor Dr. Fayek Saweris Faris, Prof. of Vegetable Crops, Horticulture Research Institute, Agriculture Research Center.

Thanks also extended to members of the strawberry and Non-traditional crops Center and Department of Horticulture, Ain Shams University for their help.

I would like to thank all the collegians at the Vegetable Research Department, Horticulture Research Institute, Agriculture Research Center for their help and support.

I wish to extend my best regards to my family for their patience and encouragement during this study period.

ABSTRACT

Ahmed Helmy Hussein. Studies on Genetical Studies on Some Morphological and Physiological Characters of Cowpea. **Unpublished Master of Agriculture Science, Ain Shams University, Faculty of Agriculture, Horticultural Department 1998.**

This study was carried out from 1995 to 1997 at the Experimental Farm of the Vegetable Research Department (Dokki) and Experimental Farm at Barrage Horticultural Experiment Station. Four cowpea cultivars and their F1 hybrids and F2 population. Data were recorded on: plant height, date flowering, number of branches/plant, pod length, number of seeds per pod, pod filling, pods weight/plant, number of pods/plant, yield of dry seeds/plant and and 100 seed weight protein content in seeds. Results cleared significant variance for all characters except protein percentage. However, genetic variance for Griffing cleared highly significant for general and specific combining ability for all characters except number of branches it was controlled by additive genes system while the specific combining ability was negative significant for this character. In addition the cross Dokki 331 x (8) IT 84S-2240 showed a high performance for all characters except number of pods/cluster and pod length.

Cowpea, Half-diallel, pods characters, heterosis, general and specific combining ability. **Key words:**

A	Names, source and some qualitative characteristics of the four cowpea genotypes used in the experiment	15
1	Mean, heterosis, inbreeding depression and combining ability effect for plant height of 4x4 diallel	20
2	Analysis of variance of plant height in 4 x 4 diallel crosses in 1997 season	20
3	Mean, heterosis, inbreeding depression and combining ability effect for number of branches per plant of 4x4 diallel crosses in 1997 season	23
4	Analysis of variance of number of branches per plant in 4 x 4 diallel crosses in 1997 season	23
5	Mean, heterosis, inbreeding depression and combining ability effect for flowering of 4x4 diallel crosses in 1997 season	26
6	Analysis of variance of flowering in 4 x 4 diallel crosses in 1997 season	26
7	Mean, heterosis, inbreeding depression and combining ability effect for number of pods per cluster of 4x4 diallel crosses in 1997 season	29
8	Analysis of variance of number of pods per cluster in 4 x 4 diallel crosses in 1997 season	29
9	Mean, heterosis, inbreeding depression and combining ability effect for number of pods per plant of 4x4 diallel crosses in 1997 season	33
10	Analysis of variance of number of pods per plant in 4 x 4 diallel crosses in 1997 season	33
11	Mean, heterosis, inbreeding depression and combining ability effect for dry seeds yield per plant of 4x4 diallel crosses in 1997 season	36

12	Analysis of variance of dry seed weight per plant in 4 x 4 diallel crosses in 1997 season	36	
13	Mean, heterosis, inbreeding depression and combining ability effect for pod length of 4x4 diallel crosses in 1997 season	40	
14	Analysis of variance of pod length in 4 x 4 diallel crosses in 1997 season		40
15	Mean, heterosis, inbreeding depression and combining ability effect for number of seeds per pod of 4x4 diallel crosses in 1997 season	43	
16	Analysis of variance of number of seeds per pod in 4 x 4 diallel crosses in 1997 season	43	
17	Mean, heterosis, inbreeding depression and combining ability effect for pod filling of 4x4 diallel crosses in 1997 season	46	
18	Analysis of variance of pod filling in 4 x 4 diallel crosses in 1997 season	46	
19	Mean, heterosis, inbreeding depression and combining ability effect for weight of pods per plant of 4x4 diallel crosses in 1997 season	49	
20	Analysis of variance of weight of pods per plant in 4 x 4 diallel crosses in 1997 season	49	
21	Mean, heterosis, inbreeding depression and combining ability effect for 100-seed weight of 4x4 diallel crosses in 1997 season	52	
22	Analysis of variance of 100-seed weight in 4 x 4 diallel crosses in 1997 season	52	
23	Analysis of variance for protein content	55	
24	Means of protein content of 4x4 diallel	55	

25	Phenotypic (pr) and genotypic (gr) correlation between seed yield and each of the ten studied traits in 4 parents and 6 F ₁ hybrids of cowpea	57
26	Phenotypic correlation for pairs of some characters effect on yield in F ₁ hybrids	57
27	Partitioning of phenotypic correlation into direct and indirect effects by path coefficient analysis for F ₁ hybrids of cowpea	60
28	Components (direct + joint effects) of seed yield/plant variation at phenotypic level in cowpea	61

1. INTRODUCTION

Cowpea (*Vigna unguiculata* (L.) Walp.) is one of the important vegetable crops in Egypt as well as many other tropical and subtropical countries in the world. Also, it is considered as one of the important sources of protein.

Cowpea is used for both green pods as well as dry seeds. Acreage cultivated with cowpea for green pods consumption in 1997 is 25632feddan* with total production of 65867 tons. As for dry seeds, the acreage was 10730 feddan and its production was about 12476 tons.

Yielding ability of the various cultivars cultivated in Egypt is somewhat low. Moreover, the various cultivars usually differ in their morphological and physiological characters.

The improvement of both quantitative and qualitative characters of cowpea such as earliness, dry seed yield and green pods. Yield depends on the presence of genetic variability that allows the breeders to select new lines and varieties. Contrasting differences in the available characteristics of cowpea varieties and lines are found. Also, hybridization is one of sources of inducing variabilities.

Therefore, the objective of this work was to study the genetic behaviour of some economic characters in cowpea using diallel crossing system. Such as study many help in developing an accurate and appropriate breeding program for improving yield and quality of cowpea. Moreover, determination of the correlation existed among the various characters facilitates improving these characters through hybridization and selection.

2. REVIEW OF LITERATURE

2.1. Vegetative growth

2.1.1 Plant height

The evaluation of parents and the intervarietal crosses for F1 and F2 generation of cowpea cultivars, with regards to plant height, have been studied by many investigators.

Gad El-Hak *et al.* (1988) found that plant height ranged from 40 to 130 cm in the different cowpea cultivars.

Jindal and Gupta (1984); Tamilselnam and Das (1994); Damarany (1994a) and Sawant (1994) found a positive correlation between plant height and seed yield. Heterosis in relation to the better parent for plant height was also reported by **Thiyagarajan (1989); Roquib and Patanik (1990)** and **Sawant (1994)**. They showed that the heterosis in the F1 hybrids ranged from 164.4 to 87.6% with a general mean 119% in F1 hybrids for plant height.

Tamilselvam and Das (1994) mentioned that plant height was positively correlated with days to 50% flowering, number of clusters/plant, pod length and 100-seed weight.

Apte *et al.* (1987) reported that the genetic gain percentage was high for plant heights as a selected criteria.

2.1.2 Number of branches/plant

Chikkadyavaiah (1985) showed that the seed yield of cowpea was positively correlated with number of branches per plant.

Apte *et al.* (1987) found that in 50 cowpea genotypes, percentage of genetic gain was high for number of branches per plant.

Senanayake and Wijerathne (1988) reported that the seed yield was negatively correlated with the number of primary branches ($r = -0.88$). On the contrary, **Pundir *et al.* (1992)** **Altinbas and Sepetoglu (1993)** and **Damarany (1994a)** reported that the seed yield was positively correlated with number of branches per plant.

Tiwari *et al.* (1993) found a highly significant specific combining ability for branches per plant.
