A Bacteriological Approach To Asymptomatic Bacteriuria In Pregnancy

THESIS

*Submitted to The High Institute of Public Health, University of Alexandria
in partial fulfillment of the requirements for the degree of
Master of Public Health*

(Microbiology)

By

Mona Mohamed El Desouky El Sayed

MBBCH, Faculty of Medicine, University of Alexandria, 1995

High Institute of Public Health
University of Alexandria
2003

SUPERVISORS

Prof. Dr. Laila Ahmed El-Attar

*Professor of Microbiology
High Institute of Public Health
University of Alexandria*

A handwritten signature in cursive script, appearing to read 'Laila', written in black ink.

Dr. Wafaa Mohamed Kamel

*Lecturer of Microbiology
High Institute of Public Health
University of Alexandria*

A handwritten signature in cursive script, appearing to read 'Wafaa', written in black ink.

DEDICATED TO

My loving parents,
sister and brother,
my sincere husband

my beloved kids

ACKNOWLEDGEMENT

After thanking Allah, the most gracious the most merciful, I wish to express my everless deepest appreciation to my eminent Professor Dr. Laila Ahmed El Attar, Professor of Microbiology, High Institute of Public Health, for suggesting the subject, her supervision, meticulous guidance and valuable advices throughout this work. I gratefully acknowledge her continuous support and great efforts without which this thesis would not have been possible to start or finish, her encouragement offered openheartedly helped me proceed in my study during difficult times. It was true honour working under her supervision.

I would like to extend my deep thanks and profound appreciation to Dr. Wafaa Mohammed Kamel, Lecturer of Microbiology, High Institute of Public health for her meticulous help, alert guidance, continuous encouragement, and the precious time she

offered me for preparing each part of this work, her untiring efforts, patient guidance, constructive criticism and sisterly attitude helped to bring this work to light. I do sincerely and warmly thank her for all what she has done to overcome many obstacles throughout this work.

Deep thanks to all members of the staff and personnel of Microbiology department in the High Institute of Public Health, who directly or indirectly helped to end this work.

Last but not least I owe lots of thanks and gratitude to my family for their constant support, understanding and endless help without which I would have never fulfilled this work. .

Protocol	
Arabic Summary	

List of Tables

Table		Page
(I)	Bacterial enzymes detected by CHROMagar Orientation and interpretation of cultures on CHROMagar Orientation	54
(II)	Identification of staphylococci and micrococci	63
(III)	Identification of lactose fermenting isolates.	65
(IV)	Confirmatory tests for identification of <i>Ps. aeruginosa</i>	66
(V)	Identification of <i>Proteus</i> spp.	67
(VI)	Urine isolates presumptively identified on CHROMagar Orientation according to color reaction	68
(VII)	Culture outcome of the studied urine specimens of 400 asymptomatic pregnant women	72
(VIII)	Distribution of 118 pathogens isolated from 106 urine specimens with significant bacteriuria	75
(IXa)	The relation between culture outcome and Gram stain results of 400 urine specimen	77
(IXb)	The value of using Gram stain results in the detection of positive and negative cultures	77

(Xa)	The relation between culture outcome of the 400 studied urine specimens and pus cell count /cmm	78
(Xb)	The value of using pyuria(≥ 10 leukocytes/cmm) in differentiating significant from non-significant bacteriuria	78
(XI)	The relation between Gram stain results and pus cell count in the 106 specimens having significant bacteriuria.	81
(XII)	Relation between the risk factors of UTI and the culture outcome of 400 asymptomatic pregnant women.	83
(XIII)	The relation between age and culture outcome of 400 asymptomatic pregnant women	85
(XIV)	The relation between gravidity and culture outcome of 400 asymptomatic pregnant women	87
(XV)	The relation between duration of pregnancy and culture outcome of 400 asymptomatic pregnant women	89
(XVI)	Distribution of the 94 monomicrobial urine isolates in relation to the used culture media.	91
(XVII)	Distribution of 24 isolates recovered from 12 polymicrobial cultures out of the 400 urine specimens	93

(XVIII)	Value of using CHROMagar Orientation in detection of different urine pathogens isolated from the 400 urine specimens	96
(XIX)	Agreement between each pair of the media used for urine culture	98
(XX)	Presumptive identification of different isolates on CHROMagar Orientation	100

List of Figures

Figure		Page
(1)	<i>Female urinary tract</i>	3
(2)	Scheme of renal tubules and its vascular supply	3
(3)	Weekly 24 hour GFR in pregnant women starting before conception and measured through the 12 th gestational weeks	7
(4)	Screening methods of urine examination	35
(5)	Microscopic field (oil immersion objective) showing the accumulation of <i>E. coli</i> at the edge of the urine drop (to the left) with the Gram-stained preparation of 10 μ l of a positive urine specimen ($\geq 10^5$ CFU/ml)	37
(6)	Microscopic picture of Gram stained urine samples	37
(7)	Streaking pattern for inoculating media for semi-quantitative bacterial colony counts	44
(8a)	Blood agar plate showing monomicrobial isolate (<i>K. pneumoniae</i>)	45
(8b)	MacConkey's agar plate showing polymicrobial growth (2 types of lactose fermenting colonies)	45
(9)	Diagram of dip-strip	46
